

CSE 167:  
Introduction to Computer Graphics  
Lecture #5: Illumination

Jürgen P. Schulze, Ph.D.  
University of California, San Diego  
Fall Quarter 2019

# Announcements

---

- ▶ **Project 2 due this Friday at 2pm**
  - ▶ Grading in basement labs B260 and B270 (others ok)
  - ▶ Upload code to Canvas by 2pm
- ▶ **Midterm #1: next Thursday in lieu of lecture**

Shading

# Shading

---

- ▶ Compute interaction of light with surfaces
- ▶ Requires simulation of physics
- ▶ “Global illumination”
  - ▶ Multiple bounces of light
  - ▶ Computationally expensive, minutes per image
  - ▶ Used in movies, architectural design, etc.
- ▶ Appearance = Material Definition + Light Sources

# Global Illumination

---

# Interactive Applications

---

- ▶ No physics-based simulation
- ▶ Simplified models
- ▶ Reproduce perceptually most important effects
- ▶ Local illumination
  - ▶ Only one bounce of light between light source and viewer

# Local Illumination

- ▶ Gives material its color
- ▶ Light can be reflected by
  - ▶ Mirror
  - ▶ White wall
  - ▶ Glossy metal
  - ▶ etc.

# Local Illumination

---

- ▶ **Model reflection of light at surfaces**
  - ▶ Assumption: no subsurface scattering
- ▶ **Bidirectional reflectance distribution function (BRDF)**
  - ▶ Given light direction, viewing direction, how much light is reflected towards the viewer
  - ▶ For any pair of light/viewing directions!

# Local Illumination

---

## **Simplified model**

- ▶ Sum of 3 components
- ▶ Covers a large class of real surfaces

# Local Illumination

---

## Simplified model

- ▶ Sum of 3 components
- ▶ Covers a large class of real surfaces

# Diffuse Reflection

---

- ▶ Ideal diffuse material reflects light equally in all directions
- ▶ View-independent
- ▶ Matte, not shiny materials
  - ▶ Paper
  - ▶ Unfinished wood
  - ▶ Unpolished stone

# Diffuse Reflection

- ▶ Beam of parallel rays shining on a surface
  - ▶ Area covered by beam varies with the angle between the beam and the normal
  - ▶ The larger the area, the less incident light per area
  - ▶ Incident light per unit area is proportional to the cosine of the angle between the normal and the light rays
- ▶ Object darkens as normal turns away from light
- ▶ Lambert's cosine law (Johann Heinrich Lambert, 1760)
- ▶ Diffuse surfaces are also called Lambertian surfaces

# Diffuse Reflection

## ▶ Given

- ▶ Unit (normalized!) surface normal  $\mathbf{n}$
- ▶ Unit (normalized!) light direction  $\mathbf{L}$
- ▶ Material diffuse reflectance (material color)  $k_d$
- ▶ Light color (intensity)  $c_l$

## ▶ Diffuse color $c_d$ is:

$$c_d = c_l k_d (\underbrace{\mathbf{n} \cdot \mathbf{L}})$$

Proportional to cosine  
between normal and light

# Diffuse Reflection

---

## Notes

- ▶ Parameters  $k_d, c_l$  are r,g,b vectors
- ▶ Need to compute r,g,b values of diffuse color  $c_d$  separately
- ▶ Parameters in this model have no precise physical meaning
  - ▶  $c_l$ : strength, color of light source
  - ▶  $k_d$ : fraction of reflected light, material color

# Diffuse Reflection

---

- ▶ Provides visual cues
  - ▶ Surface curvature
  - ▶ Depth variation

Lambertian (diffuse) sphere under different lighting directions

# Local Illumination

---

## Simplified model

- ▶ Sum of 3 components
- ▶ Covers a large class of real surfaces

# Specular Reflection

---

- ▶ **Shiny surfaces**
  - ▶ Polished metal
  - ▶ Glossy car finish
  - ▶ Plastics
- ▶ **Specular highlight**
  - ▶ Blurred reflection of the light source
  - ▶ Position of highlight depends on viewing direction

Specular highlight

# Specular Reflection

---

- ▶ Ideal specular reflection is mirror reflection
  - ▶ Perfectly smooth surface
  - ▶ Incoming light ray is bounced in single direction
  - ▶ Angle of incidence equals angle of reflection

# Projection of vector on another vector

Projection of  $\vec{a}$  on  $\vec{b}$  is  $XY$

The projection of  $\mathbf{a}$  onto  $\mathbf{b}$  will be given by:

$$\text{proj}_{\mathbf{b}} \mathbf{a} = |\mathbf{a}| \cos \theta \frac{\mathbf{b}}{|\mathbf{b}|}$$

In summary, the  $\text{proj}_{\mathbf{a}} \mathbf{b}$  has length

$$|\mathbf{a}| \cos \theta, \text{ and direction } \frac{\mathbf{b}}{|\mathbf{b}|}$$

It is called the scalar component of  $\mathbf{a}$  in the direction of  $\mathbf{b}$

# Law of Reflection

- ▶ Angle of incidence equals angle of reflection

$$\vec{R} + \vec{L} = 2 \cos \theta \, \vec{n} = 2(\vec{L} \cdot \vec{n})\vec{n}$$

$$\vec{R} = 2(\vec{L} \cdot \vec{n})\vec{n} - \vec{L}$$

# Specular Reflection

---

- ▶ Many materials are not perfect mirrors
  - ▶ Glossy materials

Glossy teapot

# Glossy Materials

- ▶ Assume surface composed of small mirrors with random orientation (micro-facets)
- ▶ Smooth surfaces
  - ▶ Micro-facet normals close to surface normal
  - ▶ Sharp highlights
- ▶ Rough surfaces
  - ▶ Micro-facet normals vary strongly
  - ▶ Blurry highlight

Polished

Smooth

Rough

Very rough

# Glossy Surfaces

---

- ▶ Expect most light to be reflected in mirror direction
- ▶ Because of micro-facets, some light is reflected slightly off ideal reflection direction
- ▶ Reflection
  - ▶ Brightest when view vector is aligned with reflection
  - ▶ Decreases as angle between view vector and reflection direction increases

# Phong Shading Model

- ▶ Developed by Bui Tuong Phong in 1973
- ▶ Specular reflectance coefficient  $k_s$
- ▶ Phong exponent  $p$ 
  - ▶ Greater  $p$  means smaller (sharper) highlight

$$c = k_s c_l (\mathbf{R} \cdot \mathbf{e})^p$$

# Phong Shading Model

# Local Illumination

---

## Simplified model

- ▶ Sum of 3 components
- ▶ Covers a large class of real surfaces

diffuse

+

specular

+

ambient

=

# Ambient Light

---

- ▶ In real world, light is bounced all around scene
- ▶ Could use global illumination techniques to simulate
- ▶ Simple approximation
  - ▶ Add constant ambient light at each point:  $k_a c_a$
  - ▶ Ambient light color:  $c_a$
  - ▶ Ambient reflection coefficient:  $k_a$
- ▶ Areas with no direct illumination are not completely dark

# Complete Phong Shading Model

- ▶ Phong model supports multiple light sources
- ▶ All light colors  $c$  and material coefficients  $k$  are 3-component vectors for red, green, blue

$$c = \sum_i c_{l_i} (k_d (L_i \cdot n) + k_s (R \cdot e)^p + k_a)$$

*Image by Brad Smith*

# Types of Shading

---

- ▶ Per-triangle
- ▶ Per-vertex
- ▶ Per-pixel

# Per-Triangle Shading

---

- ▶ A.k.a. *flat shading*
- ▶ Evaluate shading once per triangle, based on normal vector
- ▶ Advantage
  - ▶ Fast
- ▶ Disadvantage
  - ▶ Faceted appearance

# Per-Vertex Shading

---

- ▶ Known as *Gouraud shading* (→ Henri Gouraud, 1971)
- ▶ Interpolates vertex colors across triangles
- ▶ Advantages
  - ▶ Fast (no less work in fragment shader)
  - ▶ Smoother surface appearance than with flat shading
- ▶ Disadvantage
  - ▶ Problems with small highlights

# Per-Pixel Shading

- ▶ A.k.a. *Phong Interpolation* (not to be confused with *Phong Illumination Model*)
  - ▶ Rasterizer interpolates normals (instead of colors) across triangles
  - ▶ Illumination model is evaluated at each pixel
  - ▶ Simulates shading with normals of a curved surface
- ▶ Advantage
  - ▶ Highest rendering quality
- ▶ Disadvantage
  - ▶ Slow

Source: Penny Rheingans, UMBC

# Gouraud vs. Per-Pixel Shading

---

- ▶ Gouraud shading has problems with highlights when polygons are large
- ▶ More triangles improve the result, but reduce frame rate
- ▶ Video: <https://www.youtube.com/watch?v=Fl5i-UnlQps&feature=youtu.be>

Gouraud

Per-Pixel

# Summary

---

- ▶ Per-pixel shading looks best and is only slightly more computationally expensive
- ▶ On slower GPUs Gouraud shading may make sense (e.g., in OpenGL ES on older mobile devices)
- ▶ In CSE 167 we always use per-pixel shading

Lights

# Light Sources

---

- ▶ Real light sources can have complex properties
  - ▶ Geometric area over which light is produced
  - ▶ Anisotropy (directionally dependent)
  - ▶ Reflective surfaces act as light sources (indirect light)

- ▶ Need to use simplified model for real-time rendering

# Types of Light Sources

---

- ▶ At each point on surfaces we need to know
  - ▶ Direction of incoming light (the  $\mathbf{L}$  vector)
  - ▶ Intensity of incoming light (the  $c_l$  values)
- ▶ Three light types:
  - ▶ **Directional**: from a specific direction
  - ▶ **Point light**: from a specific point
  - ▶ **Spotlight**: from a specific point with intensity that depends on direction

# Lecture Overview

---

- ▶ **Light Sources**
  - ▶ Directional Lights
  - ▶ Point Lights
  - ▶ Spot Lights

# Directional Light

- ▶ Light from a distant source
  - ▶ Light rays are parallel
  - ▶ Direction and intensity are the same everywhere
  - ▶ As if the source were infinitely far away
  - ▶ Good approximation of sunlight
- ▶ Specified by a unit length direction vector, and a color

$c_{src}$

Light source

$\mathbf{d}$

$c_l$

$\mathbf{L}$

$\mathbf{n}$

Receiving surface

$$\mathbf{L} = -\mathbf{d}$$

$$c_l = c_{src}$$

# Lecture Overview

---

- ▶ **Light Sources**
  - ▶ Directional Lights
  - ▶ **Point Lights**
  - ▶ Spot Lights

# Point Lights

---

- ▶ Similar to light bulbs
- ▶ Infinitely small point radiates light equally in all directions
  - ▶ Light vector varies across receiving surface
  - ▶ What is light intensity over distance proportional to?
  - ▶ Intensity drops off proportionally to the inverse square of the distance from the light
    - ▶ Reason for inverse square falloff:  
Surface area  $A$  of sphere:  
 $A = 4 \pi r^2$

# Point Light Math

At any point  $\mathbf{v}$  on the surface:

$$\mathbf{L} = \frac{\mathbf{p} - \mathbf{v}}{\|\mathbf{p} - \mathbf{v}\|}$$

Attenuation:

$$c_l = \frac{c_{src}}{\|\mathbf{p} - \mathbf{v}\|^2}$$

# Light Attenuation

---

- ▶ Adding constant factor  $k$  to denominator for better control
- ▶ Quadratic attenuation:  $k \cdot (p-v)^2$ 
  - ▶ Most computationally expensive, most physically correct
- ▶ Linear attenuation:  $k \cdot (p-v)$ 
  - ▶ Less expensive, less accurate
- ▶ Constant attenuation:  $k$ 
  - ▶ Fastest computation, least accurate

# Lecture Overview

---

- ▶ **Light Sources**
  - ▶ Directional Lights
  - ▶ Point Lights
  - ▶ **Spot Lights**

# Spotlights

---

- ▶ Like point light, but intensity depends on direction

## Parameters

- ▶ Position: location of light source
- ▶ Cone direction  $d$ : center axis of light source
- ▶ Intensity falloff:
  - ▶ Beam width (cone angle  $\theta_{max}$ )
  - ▶ The way the light tapers off at the edges of the beam (cosine exponent  $f$ )

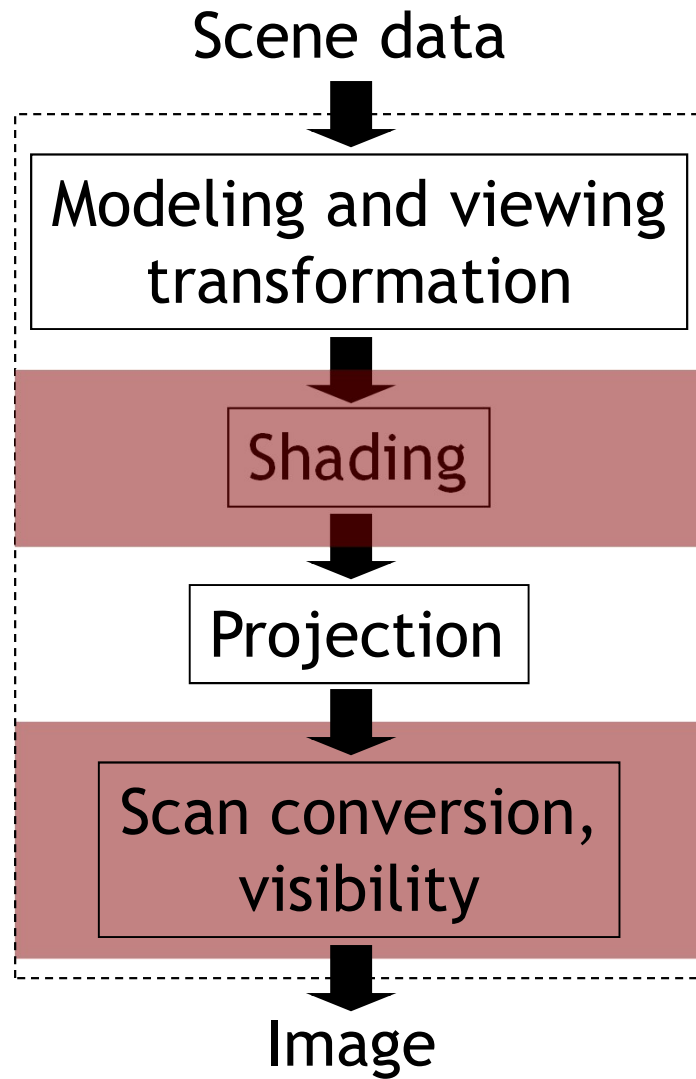

# Spotlights

$$\mathbf{L} = \frac{\mathbf{p} - \mathbf{v}}{\|\mathbf{p} - \mathbf{v}\|}$$

$$c_l = \begin{cases} 0 & \text{if } -\mathbf{L} \cdot \mathbf{d} \leq \cos(\theta_{max}) \\ c_{src} (-\mathbf{L} \cdot \mathbf{d})^f & \text{otherwise} \end{cases}$$

# Rendering Pipeline

- Place object in 3D space
- Determine colors of vertices
  - Per vertex shading
- Map triangles to 2D
- Draw triangles
  - Per pixel shading

# Vertex Shader
