CSE 165: 3D User Interaction

Lecture #15:

3D UI Design Part 2

Announcements

- Homework 4 due tomorrow
- Homework 5 to go on-line Saturday
- Input devices can be returned
  - this Friday
  - in office hour Tue 1:30pm
  - after final presentation
  - any time I'm in the office
- WAVE tour March 8th after paper presentations

3DUI Design

- Two main strategies
  - Designing for humans
    - Match design to human strengths
  - Inventing 3D interaction techniques
    - Creative exploration of 3D UIs

Designing for Humans - Feedback

- Feedback is critical to usable 3D interfaces
  - User feedback is any information conveyed to the user to help understand
    - system state
    - result of operation
    - status of task
- Feedback control mechanism
  - Example: turning a knob produces feedback by
    - External sources: the knob
    - Internal sources: user's body
- Want to have appropriate feedback levels
- Ensure compliance (agreement) between different levels/types of feedback

Designing for Humans – Feedback in Multiple Dimensions

- Sensory dimensions
  - Visual, auditory, tactile, olfactory
  - Proprioceptive: relative position of neighboring parts of the body
  - Kinesthetic: bodily motion
- Want to try to give multi-dimensional feedback
  - Can be difficult due to technology (e.g., haptic devices)
  - Sensory feedback substitution
    - Example: visual/audio cues compensate for missing haptic feedback
- System-based feedback
  - Reactive – from sensory dimensions
  - Instrumental – generated by devices
  - Operational – changes in virtual world

Designing for Humans – Compliance

- Main principle in design feedback
- Want different feedback dimensions in sync
  - Maintain spatial and temporal correspondence between multiple feedback dimensions
- Feedback displacement is bad!
  - Example: hand and virtual object move in different directions

Designing for Humans – Spatial Compliance

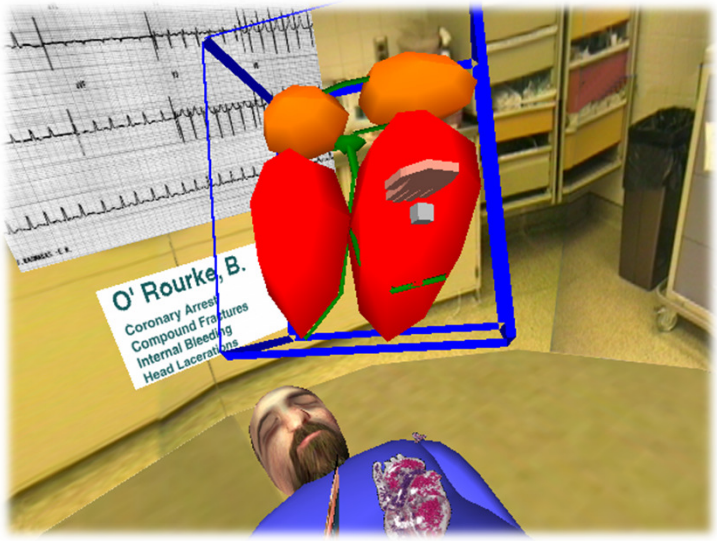
- Directional compliance – virtual object should move in the same direction as manipulated by input device
- Nulling compliance – when user returns device to initial pose, virtual object returns to corresponding initial pose
- Instrumental and operational feedback also require spatial compliance
  - Example: real and virtual hand should be aligned

Designing for Humans – Temporal Compliance

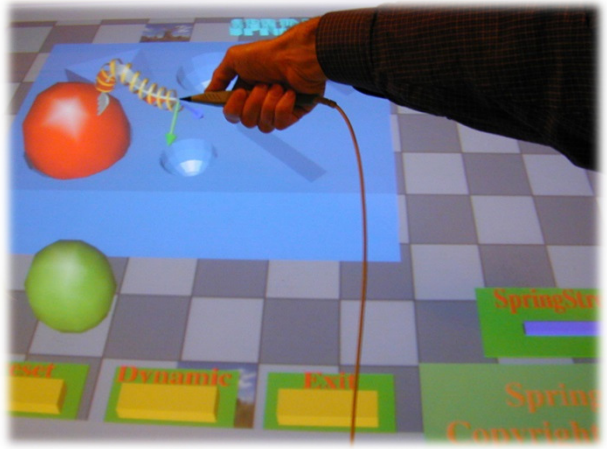
- Latency – typical problem
  - Temporal delay between user input and sensory feedback
  - Incompliance with internal feedback
- Variable latency can be even more problematic
- Solutions?
  - Reduce scene complexity
  - Faster hardware
  - Predictive tracking

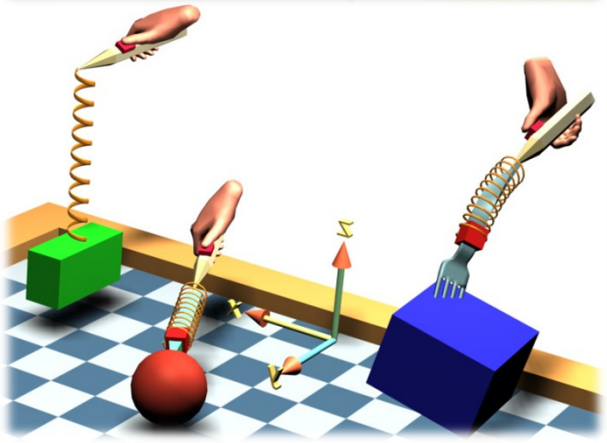
Designing for Humans – Feedback Substitution

- Cannot always support all sensory feedback dimensions
- Typical approach is to substitute



Highlighting object about to be selected

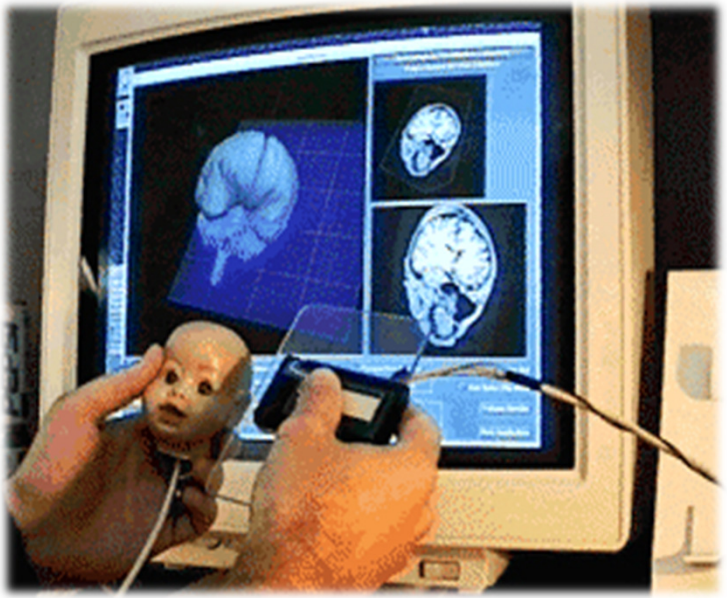




Spring Manipulation Tools, Michal Koutek, TU Delft

Designing for Humans – Passive Haptics

- Match shape and appearance of virtual object with physical prop
  - User both sees and feels
- Advantages
  - Inexpensive haptic/tactile feedback
  - Establish perceptual frame of reference
- Disadvantages
  - Scalability
  - Performance improvements have not yet been measured



Designing for Humans – Constraints

- Constraints:
  - Are a relation between variables that must be satisfied
    - Example: a line should stay horizontal
  - Define geometrical coherence of scene
  - Can make interaction simpler and improve accuracy

Designing for Humans – Constraint Types

- Physically realistic constraints
  - Collision detection and avoidance
  - Gravity
  - Application dependent
- DOF reduction
  - Simplify interaction (example: constrain travel to ground)
- Dynamic alignment tools
  - Grids and snapping, guiding surfaces
- Intelligent constraints
  - Deal with semantics
    - Example: lamp can only stand on horizontal surfaces

Designing for Humans – Two Handed Control

- Also known as bimanual input
- Transfer everyday manipulation experiences to 3DUI
- Can increase user performance on certain tasks
- Active topic of research

Designing for Humans – Guiard's Framework

- Tasks are
  - Unimanual: throwing darts
  - Bimanual symmetric
    - Synchronous: pulling a rope
    - Asynchronous: typing on keyboard
  - Bimanual asymmetric (cooperative): holding a cell phone with one hand, operating it with the other
- Division of labor (hand roles) for asymmetric scenario:
  - Nondominant hand dynamically adjusts spatial frame of reference for dominant hand
  - Dominant hand produces precision movements, nondominant hand performs gross manipulation
  - Manipulation is initiated by nondominant hand

Designing for Different User Groups

- Age
- Prior 3DUI experience
- Physical characteristics: arm length, etc.
- Perceptual, cognitive, motor capabilities
  - Color recognition
  - Stereo vision
  - Spatial abilities

Designing for User Comfort

- Weight of equipment
- Keep users in proper physical space
- Hygiene and public installations
- Keep sessions short (30-45min max) to prevent sickness, fatigue
