

CSE 165: 3D User Interaction

Lecture 6:
Wayfinding - Concept

Announcements

- Sunday, January 24th at 11:59pm:
 - Homework Project 1 due
- Sunday, January 31st at 11:59pm:
 - Late deadline for project 1
- Sunday, February 7th at 11:59pm:
 - Homework project 2 due

3D UI Presentations

- Patrick Pajarillaga
 - VR in focus: The first foveated light-field Virtual Reality experience by CREAL
- Dayyan Sisson
 - 360 VR Design in Adobe Xd | DraftXR | Design Weekly

Navigation

- Navigation = Wayfinding + Travel
 - Wayfinding: Cognitive Component
 - Travel: Motor Component

Today's Focus: Wayfinding

- Cognitive process of defining a path through an environment
 - use and acquire spatial knowledge
 - aided by natural and artificial cues
- Common activity in our daily lives
- Often unconscious activity (except when we are lost)

Information for the Wayfinding Task

- Landmarks
- Signs
- Maps
- Directional information

Wayfinding in Virtual Worlds

- Issues with wayfinding in virtual world compared to real world:
 - Less constrained movement
 - 6 DOF possible
 - Absence of physical constraints
 - No fundamental limitations by vehicle or environment
 - Lack of physical motion cues
 - User's motion in physical space does not match motion in virtual space

Wayfinding in Virtual Worlds

- Advantages of wayfinding in virtual worlds:
 - Potential to provide much more information
 - Distractions have less severe consequences

Objectives for Wayfinding

- Exploration
 - browse environment
 - useful to build cognitive map
- Search
 - spatial knowledge acquired and used
 - naïve search – not enough info in cognitive map
 - primed search – use of cognitive map

Useful Spatial Knowledge

- Landmark knowledge
 - visual characteristics of environment
 - shape, size, texture
 - relative positioning
- Procedural knowledge
 - sequence of actions required to follow a path (e.g., turn by turn directions)
 - requires only sparse visual information
- Survey knowledge
 - maps
 - topographical knowledge

Egocentric and Exocentric Reference Frames

- Egocentric – first person
 - viewpoint in reference frame of human body
- Exocentric – third person
 - viewpoint in reference frame of world
- We use egocentric when exploring for first time
 - creates landmark/procedural knowledge
- Repeated wayfinding builds up exocentric representation of world
 - creates survey knowledge

User-Centered Wayfinding Support

- Large field of view desirable
 - small FOV can inhibit wayfinding
 - especially with HMDs
 - user requires repetitive head movements
 - lack of optical flow in periphery
- Motion cues
 - enable judgment of depth and direction
 - supports backtracking of user's own movement
 - cue conflicts (physical vs. virtual) can hinder cognitive map development

User-Centered Wayfinding Support

- Presence (feeling of “being there”)
 - assumed to have impact on spatial knowledge
- Search strategies

Environment-Centered Wayfinding Support

- Environmental design
- Artificial aids

Environmental Design

- World's structure and format can aid in wayfinding
- Legibility techniques
 - divide large scale environment into parts with distinct character
 - create simple spatial organization
 - include directional cues to support egocentric/exocentric reference frames
 - often repetitive

Environmental Design

- ◉ Natural environment
 - ◉ horizon, atmospheric color, fog, etc.
- ◉ Architectural design
 - ◉ lighting
 - ◉ closed and open spaces
- ◉ Color and texture
