

CSE 167:
Introduction to Computer Graphics
Lecture #16: Shadow Mapping

Jürgen P. Schulze, Ph.D.
University of California, San Diego
Fall Quarter 2018

Announcements

- ▶ **Tonight: Final Project blog #1 due**
- ▶ **This Thursday: Midterm #2**
 - ▶ In-class
 - ▶ Closed book
 - ▶ Bring pen/pencil, ruler, eraser
 - ▶ Scratch paper optional

Why Are Shadows Important?

- ▶ Give additional cues on scene lighting

Why Are Shadows Important?

- ▶ Contact points
- ▶ Depth cues

A

Why Are Shadows Important?

► Realism

Without self-shadowing

With self-shadowing

Terminology

- ▶ **Umbra**: fully shadowed region
- ▶ **Penumbra**: partially shadowed region

Hard and Soft Shadows

- ▶ Point and directional lights lead to hard shadows, no penumbra
- ▶ Area light sources lead to soft shadows, with penumbra

Hard and Soft Shadows

Hard shadow from
point light source

Soft shadow from
area light source

Shadows for Interactive Rendering

- ▶ In this course: hard shadows only
 - ▶ Soft shadows hard to compute in interactive graphics
- ▶ Two most popular techniques:
 - ▶ Shadow mapping
 - ▶ Shadow volumes
- ▶ Many variations, subtleties
- ▶ Active research area

Shadow Mapping

Main Idea

- ▶ A scene point is lit by the light source if **visible** from the light source
- ▶ Determine visibility from light source by placing a **camera at the light source position** and rendering the scene from there

Two Pass Algorithm

First Pass

- ▶ Render scene by placing camera at light source position
- ▶ Store depth image (*shadow map*)

Depth image as seen
from light source

Two Pass Algorithm

Second Pass

- ▶ Render scene from camera position
- ▶ At each pixel, compare distance to light source with value in shadow map
 - ▶ If distance is larger, pixel is in shadow
 - ▶ If distance is smaller or equal, pixel is lit

Final image with shadows

Shadow Map Look-Up

- ▶ Need to transform each point from object space to shadow map
- ▶ Shadow map texture coordinates are in $[0,1]^2$
- ▶ Transformation from object to shadow map coordinates

$$\mathbf{T} = \begin{bmatrix} 1/2 & 0 & 0 & 1/2 \\ 0 & 1/2 & 0 & 1/2 \\ 0 & 0 & 1/2 & 1/2 \\ 0 & 0 & 0 & 1 \end{bmatrix} \mathbf{P}_{light} \mathbf{V}_{light} \mathbf{M}$$

- ▶ \mathbf{T} is called texture matrix
- ▶ After perspective projection we have shadow map coordinates

Shadow Map Look-Up

- ▶ Transform each vertex to normalized frustum of light

$$\begin{bmatrix} s \\ t \\ r \\ q \end{bmatrix} = \mathbf{T} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

- ▶ Pass s,t,r,q as texture coordinates to rasterizer
- ▶ Rasterizer interpolates s,t,r,q to each pixel
- ▶ Use **projective texturing** to look up shadow map
 - ▶ This means, the texturing unit automatically computes $s/q, t/q, r/q, 1$
 - ▶ $s/q, t/q$ are shadow map coordinates in $[0,1]^2$
 - ▶ r/q is depth in light space
- ▶ Shadow depth test: compare shadow map at $(s/q, t/q)$ to r/q

GLSL Specifics

In application

- ▶ Store matrix **T** in OpenGL texture matrix
- ▶ Set using `glMatrixMode(GL_TEXTURE)`

In vertex shader

- ▶ Access texture matrix through predefined uniform `gl_TextureMatrix`

In fragment shader

- ▶ Declare shadow map as `sampler2DShadow`
- ▶ Look up shadow map using projective texturing with `vec4 texture2DProj(sampler2D, vec4)`

Implementation Specifics

- ▶ When you do a projective texture look up on a `sampler2DShadow`, the depth test is performed automatically
 - ▶ Return value is (1,1,1,1) if lit
 - ▶ Return value is (0,0,0,1) if shadowed
- ▶ Simply multiply result of shading with current light source with this value

Demo

- ▶ Shadow mapping demo from

<http://www.paulsprojects.net/opengl/shadowmap/shadowmap.html>

Tutorial URL

- ▶ <http://www.opengl-tutorial.org/intermediate-tutorials/tutorial-16-shadow-mapping/>

Issues With Shadow Maps

- ▶ Sampling problems
- ▶ Limited field of view of shadow map
- ▶ Z-fighting

Sampling Problems

- ▶ Shadow map pixel may project to many image pixels
→ Stair-stepping artifacts

Solutions

- ▶ Increase resolution of shadow map
 - ▶ Not always sufficient
- ▶ Split shadow map into several tiles
- ▶ Tweak projection for shadow map rendering
 - ▶ Light space perspective shadow maps (LiSPSM)
<http://www.cg.tuwien.ac.at/research/vr/lispsm/>

- ▶ Combination of splitting and LiSPSM
 - ▶ Basis for most commercial implementations

Limited Field of View

- ▶ What if a scene point is outside the field of view of the shadow map?

Limited Field of View

- ▶ What if a scene point is outside the field of view of the shadow map?
 - Use six shadow maps, arranged in a cube
- ▶ Requires a rendering pass for each shadow map

Solution: Bias

- ▶ Add **bias** when rendering shadow map
 - ▶ Move geometry away from light by small amount
- ▶ Finding correct amount of bias is tricky

Correct bias

Not enough bias

Too much bias

Bias Adjustment

Not enough

Too much

Just right

Shadow Mapping for Directional Lights

- ▶ Shadow mapping for directional light sources can be done with orthographic projection in step one when creating the shadow map.
- ▶ More information at:
 - ▶ <http://www.opengl-tutorial.org/intermediate-tutorials/tutorial-16-shadow-mapping/>
