

CSE 167:
Introduction to Computer Graphics
Lecture #14: Procedural Modeling

Jürgen P. Schulze, Ph.D.
University of California, San Diego
Fall Quarter 2015

Announcements

- ▶ Project 6 due tomorrow
- ▶ Monday: Midterm discussion
- ▶ Next Thursday: Midterm #2
- ▶ Final project description released tomorrow evening

Lecture Overview

- ▶ Procedural Modeling
 - ▶ Concepts
 - ▶ Algorithms

3D Modeling

- ▶ Creating 3D objects/scenes and defining their appearance (texture, etc.)
- ▶ So far we created
 - ▶ Triangle meshes
 - ▶ Bezier patches
- ▶ Interactive modeling
 - ▶ Place vertices, control points manually
- ▶ For realistic scenes, need extremely complex models containing millions or billions of primitives
- ▶ Modeling everything manually is extremely tedious

Alternatives

▶ Data-driven modeling

- ▶ Scan model geometry from real world examples
- ▶ Use laser scanners or similar devices
- ▶ Use photographs as textures
- ▶ Archives of 3D models

- ▶ <http://www-graphics.stanford.edu/data/3Dscanrep/>

- ▶ Reader for PLY point file format:
<http://w3.impa.br/~diego/software/rply/>

▶ Procedural modeling

- ▶ Construct 3D models and/or textures algorithmically

Photograph

Rendering

[Levoy et al.]

Procedural Modeling

- ▶ Wide variety of techniques for algorithmic model creation
- ▶ Used to create models too complex (or tedious) to build manually
 - ▶ Terrain, clouds
 - ▶ Plants, ecosystems
 - ▶ Buildings, cities
- ▶ Usually defined by a small set of data, or rules, that describes the overall properties of the model
 - ▶ Tree defined by branching properties and leaf shapes
- ▶ Model is constructed by an algorithm
 - ▶ Often includes randomness to add variety
 - ▶ E.g., a single tree pattern can be used to model an entire forest

[Deussen et al.]

Randomness

- ▶ Use some sort of randomness to make models more interesting, natural, less uniform
- ▶ *Pseudorandom* number generation algorithms
 - ▶ Produce a sequence of (apparently) random numbers based on some initial seed value
- ▶ Pseudorandom sequences are repeatable, as one can always reset the sequence
 - ▶ E.g., if a tree is built using pseudorandom numbers, then the entire tree can be rebuilt by resetting the seed value
 - ▶ If the seed value is changed, a different sequence of numbers will be generated, resulting in a (slightly) different tree

Recursion

- ▶ Repeatedly apply the same operation (set of operations) to an object
- ▶ Generate self-similar objects: **fractals**
 - ▶ Objects which look similar when viewed at different scales
- ▶ For example, the shape of a coastline may appear as a jagged line on a map
 - ▶ As we zoom in, we see that there is more and more detail at finer scales
 - ▶ We always see a jagged line no matter how close we look at the coastline
