

CSE 167:
Introduction to Computer Graphics
Lecture #18: Deferred Rendering

Jürgen P. Schulze, Ph.D.
University of California, San Diego
Fall Quarter 2012

Announcements

- ▶ Thursday, Dec 13: Final project presentations in EBU-3B room 1202, 3-6pm
- ▶ Move CSE 190 (3D User Interfaces)
 - ▶ Currently scheduled for Mon/Wed 11-12:20
 - ▶ Conflicts with CSE 105 and CSE 141
 - ▶ Alternatives:
 - ▶ Mon/Wed 11:00-12:20pm
 - ▶ Mon/Wed 12:30-1:50pm
 - ▶ Mon/Wed 2-3:20pm
 - ▶ Tue/Thu 11-12:20pm
 - ▶ Tue/Thu 12:30-1:50pm
 - ▶ Tue/Thu 2-3:20pm

Lecture Overview

- ▶ **Deferred Rendering Techniques**
 - ▶ Deferred Shading
 - ▶ Screen Space Ambient Occlusion
 - ▶ Bloom
 - ▶ Glow
- ▶ The Future of Computer Graphics

Deferred Rendering

- ▶ Opposite to Forward Rendering, which is the way we have rendered with OpenGL so far
- ▶ Deferred rendering describes post-processing algorithms
 - ▶ Requires two-pass rendering
 - ▶ First pass:
 - ▶ Scene is rendered as usual by projecting 3D primitives to 2D screen space.
 - ▶ Additionally, an off-screen buffer (G-buffer) is populated with additional information about the geometry elements at every pixel
 - Examples: normals, diffuse shading color, position, texture coordinates
 - ▶ Second pass:
 - ▶ An algorithm, typically implemented as a shader, processes the G-buffer to generate the final image in the back buffer

Lecture Overview

- ▶ Deferred Rendering Techniques
 - ▶ Deferred Shading
 - ▶ Screen Space Ambient Occlusion
 - ▶ Bloom
 - ▶ Glow
- ▶ The Future of Computer Graphics

Deferred Shading

- ▶ Postpones shading calculations for a fragment until its visibility is completely determined
 - ▶ Only fragments that really contribute to the image are shaded
- ▶ Algorithm:
 - ▶ Fill a set of buffers with common data, such as diffuse texture, normals, material properties
 - ▶ For the lighting just render the light extents and fetch data from these buffers for the lighting computation
- ▶ Advantages:
 - ▶ Decouples lighting from geometry
 - ▶ Several lights can be applied with a single draw call: more than 1000 light sources can be rendered at 60 fps
- ▶ Disadvantages:
 - ▶ Consumes more memory, bandwidth and shader instructions than traditional rendering

Lecture Overview

- ▶ Deferred Rendering Techniques
 - ▶ Deferred Shading
 - ▶ Screen Space Ambient Occlusion
 - ▶ Bloom
 - ▶ Glow
- ▶ The Future of Computer Graphics

Screen Space Ambient Occlusion

- ▶ Screen Space Ambient Occlusion is abbreviated as SSAO
- ▶ “Screen Space” refers to this being a deferred rendering approach
- ▶ Rendering technique for approximating ambient occlusion in real time
- ▶ Developed by Vladimir Kajalin while working at Crytek
- ▶ First use in 2007 PC game Crysis

Ambient Occlusion

- ▶ Attempts to approximate global illumination
 - ▶ Very crude approximation
- ▶ Unlike local methods like Phong shading, ambient occlusion is a global method
 - ▶ Illumination at each point is a function of other geometry in the scene
- ▶ Appearance achieved by ambient occlusion is similar to the way an object appears on an overcast day
 - ▶ Example: arm pit is hit by a lot less light than top of head
- ▶ In the industry, ambient occlusion is often referred to as "sky light"

SSAO Demo

- ▶ Screen Space Ambient Occlusion (SSAO) in Crysis
 - ▶ <http://www.youtube.com/watch?v=ifdAILHTcZk>

Basic SSAO Algorithm

- ▶ **First pass:**
 - ▶ Render scene normally and write z values to g-buffer's alpha channel
- ▶ **Second pass:**
 - ▶ Pixel shader samples depth values around the processed fragment and computes amount of occlusion, stores result in red channel
 - ▶ Occlusion depends on depth difference between sampled fragment and currently processed fragment

Ambient occlusion values in red color channel

SSAO With Normals

- ▶ **First pass:**
 - ▶ Render scene normally and copy z values to g-buffer's alpha channel and scene normals to g-buffer's RGB channels
- ▶ **Second pass:**
 - ▶ Use normals and z-values to compute occlusion between current pixel and several samples around that pixel

No SSAO

With SSAO

SSAO Discussion

▶ Advantages:

- ▶ Deferred rendering algorithm: independent of scene complexity
- ▶ No pre-processing, no memory allocation in RAM
- ▶ Works with dynamic scenes
- ▶ Works in the same way for every pixel
- ▶ No CPU usage: executed completely on GPU

▶ Disadvantages:

- ▶ Local and view-dependent (dependent on adjacent texel depths)
- ▶ Hard to correctly smooth/blur out noise without interfering with depth discontinuities, such as object edges, which should not be smoothed out

Lecture Overview

- ▶ Deferred Rendering Techniques
 - ▶ Deferred Shading
 - ▶ Screen Space Ambient Occlusion
 - ▶ Bloom
 - ▶ Glow
- ▶ The Future of Computer Graphics

Bloom Effect

Left: no bloom, right: bloom.
Source: <http://jmonkeyengine.org>

- Bloom gives a scene a look of bright lighting and overexposure

Bloom Shader

- ▶ Post-processing filter: applied after scene is rendered normally
- ▶ Step 1: Extract all highlights of the rendered scene, superimpose them and make them more intense
 - ▶ Operates on back buffer
 - ▶ Often done with off-screen buffer smaller than frame buffer
 - ▶ Highlights found by thresholding luminance
- ▶ Step 2: Blur off-screen buffer, e.g., with Gaussian blurring
- ▶ Step 3: Composite off-screen buffer with back buffer

Bloom shader render steps.

 - ▶ Deferred Shading
 - ▶ Screen Space Ambient Occlusion
 - ▶ Bloom
 - ▶ **Glow**
- ▶ The Future of Computer Graphics

Glow Effects

- ▶ Glows and halos of light appear everywhere in the world
- ▶ They provide powerful visual cues about brightness and atmosphere
- ▶ In computer graphics, the intensity of light reaching the eye is limited, so the only way to distinguish intense sources of light is by their surrounding glow and halos
- ▶ In everyday life, glows and halos are caused by light scattering in the atmosphere or within our eyes

*A cityscape with and without glow.
Source: GPU Gems*

Glow vs. Bloom

- ▶ Bloom filter looks for highlights automatically, based on a threshold value
- ▶ If you want to have more control over what glows and does not glow, a glow filter is needed
- ▶ Glow filter adds an additional step to Bloom filter: instead of thresholding, only the glowing objects are rendered
- ▶ Render passes:
 - ▶ Render entire scene back buffer
 - ▶ Render only glowing objects to a smaller off-screen glow buffer
 - ▶ Apply a bloom pixel shader to glow buffer
 - ▶ Compose back buffer and glow buffer together
