

CSE 167:  
Introduction to Computer Graphics  
Lecture #5: Visibility, OpenGL

Jürgen P. Schulze, Ph.D.  
University of California, San Diego  
Fall Quarter 2016

# Announcements

---

- ▶ Tomorrow: assignment 1 due
- ▶ Grading starts at 2pm in labs 260 and 270
- ▶ Need to upload code to TritonEd by 2pm
- ▶ We'll be grading at least until 4pm

# Visibility

- At each pixel, we need to determine which triangle is visible

# Painter's Algorithm

---

- ▶ Paint from back to front
- ▶ Need to sort geometry according to depth
- ▶ Every new pixel always paints over previous pixel in frame buffer
- ▶ May need to split triangles if they intersect

- ▶ Intuitive, but outdated algorithm - created when memory was expensive
- ▶ Needed for translucent geometry even today

# Z-Buffering

---

- ▶ Store z-value for each pixel
- ▶ Depth test
  - ▶ Initialize z-buffer with farthest z value
  - ▶ During rasterization, compare stored value to new value
  - ▶ Update pixel only if new value is smaller

```
setpixel(int x, int y, color c, float z)
if(z < zbuffer(x,y)) then
    zbuffer(x,y) = z
    color(x,y) = c
```

- ▶ z-buffer is dedicated memory reserved in GPU memory
- ▶ Depth test is performed by GPU → very fast

# Z-Buffering in OpenGL

---

- ▶ In OpenGL applications:
  - ▶ Ask for a depth buffer when you create your GLFW window.
    - ▶ `glfwOpenWindow(512, 512, 8, 8, 8, 0, 16, 0, GLFW_WINDOW)`
  - ▶ Place a call to `glEnable(GL_DEPTH_TEST)` in your program's initialization routine.
  - ▶ Ensure that your *zNear* and *zFar* clipping planes are set correctly (`glm::perspective(fovy, aspect, zNear, zFar)`) and in a way that provides adequate depth buffer precision.
  - ▶ Pass `GL_DEPTH_BUFFER_BIT` as a parameter to `glClear`.
- ▶ Note that the z buffer is non-linear: it uses smaller depth bins in the foreground, larger ones further from the camera.

# Z-Buffer Fighting

---

- ▶ Problem: polygons which are close together don't get rendered correctly. Errors change with camera perspective → flicker
- ▶ Cause: differently colored fragments from different polygons are being rasterized to same pixel and depth → not clear which is in front of which
- ▶ Solutions:
  - ▶ move surfaces farther apart, so that fragments rasterize into different depth bins
  - ▶ bring near and far planes closer together
  - ▶ use a higher precision depth buffer. Note that OpenGL often defaults to 16 bit even if your graphics card supports 24 bit or 32 bit depth buffers

# Translucent Geometry

---

- ▶ Need to depth sort translucent geometry and render with Painter's Algorithm (back to front)
- ▶ Problem: incorrect blending with cyclically overlapping geometry

- ▶ Solutions:
  - ▶ Back to front rendering of translucent geometry (Painter's Algorithm), after rendering opaque geometry
    - ▶ Does not always work correctly: programmer has to weigh rendering correctness against computational effort
  - ▶ Theoretically: need to store multiple depth and color values per pixel (not practical in real-time graphics)

# Introduction to OpenGL

---

- ▶ Using slides from SIGGRAPH course:

# OpenGL and GLFW Overview

---

- ▶ What is OpenGL & what can it do for me?
- ▶ OpenGL in windowing systems
- ▶ Why GLFW
- ▶ A GLFW program template

# What Is OpenGL?

---

- ▶ **Graphics rendering API**
  - ▶ high-quality color images composed of geometric and image primitives
  - ▶ window system independent
  - ▶ operating system independent

# OpenGL as a Renderer

---

- ▶ **Geometric primitives**
  - ▶ points, lines and polygons
- ▶ **Image Primitives**
  - ▶ images and bitmaps
  - ▶ separate pipeline for images and geometry
    - ▶ linked through texture mapping
- ▶ **Rendering depends on state**
  - ▶ colors, materials, light sources, etc.

## Related APIs

---

- ▶ **GLU (OpenGL Utility Library)**
  - ▶ part of OpenGL
  - ▶ NURBS, tessellators, quadric shapes, etc.
- ▶ **GLFW (OpenGL Utility Toolkit)**
  - ▶ portable windowing API
  - ▶ not officially part of OpenGL

# Preliminaries

---

## ▶ Headers Files

- ▶ `#include <GL/gl.h>`
- ▶ `#include <GL/glu.h>`
- ▶ `#include <GLFW/glfw3.h>`

## ▶ Libraries

## ▶ Enumerated Types

- ▶ OpenGL defines numerous types for compatibility
  - GLfloat, GLint, GLenum, etc.

# GLFW Basics

---

- ▶ **Application Structure**
  - ▶ Configure and open window
  - ▶ Initialize OpenGL state
  - ▶ Enter event processing loop

# Sample Program

---

```
#include <GLFW/glfw3.h>

int main(void)
{
    GLFWwindow* window;

    /* Initialize the library */
    if (!glfwInit()) return -1;

    /* Create a windowed mode window and its OpenGL context */
    window = glfwCreateWindow(640, 480, "Hello CSE 167", NULL, NULL);
    if (!window)
    {
        glfwTerminate();
        return -1;
    }
    /* Make the window's context current */
    glfwMakeContextCurrent(window);

    /* Initialize OpenGL here */

    /* Loop until the user closes the window */
    while (!glfwWindowShouldClose(window))
    {
        /* Render here with OpenGL */

        /* Swap front and back buffers */
        glfwSwapBuffers(window);

        /* Poll for and process events */
        glfwPollEvents();
    }
    glfwTerminate();
    return 0;
}
```

---

# OpenGL Initialization

---

- ▶ Set up whatever state you are going to use

```
void init( void )
{
    glClearColor( 0.0, 0.0, 0.0, 1.0 );
    glClearDepth( 1.0 );

    glEnable( GL_LIGHT0 );
    glEnable( GL_LIGHTING );
    glEnable( GL_DEPTH_TEST );
}
```

# Elementary Rendering

---

- ▶ Geometric Primitives
- ▶ Managing OpenGL State
- ▶ OpenGL Buffers

# OpenGL Geometric Primitives

- ▶ All geometric primitives are specified by vertices

# OpenGL's State Machine

---

- ▶ All rendering attributes are encapsulated in the OpenGL State
  - ▶ rendering styles
  - ▶ texture mapping
  - ▶ control of programmable shaders

# Manipulating the OpenGL State

---

- ▶ **Appearance is controlled by current state**  
for each ( primitive to render )  
{  
    update OpenGL state  
    render primitive  
}

# Manipulating the OpenGL State

---

- ▶ Setting the State

```
glPointSize( size );  
glLineStipple( repeat, pattern );
```

- ▶ Enabling Features

```
glEnable( GL_LIGHTING );  
glDisable( GL_TEXTURE_2D );
```

---

# Debugging OpenGL Code

# OpenGL error state: glGetError()

---

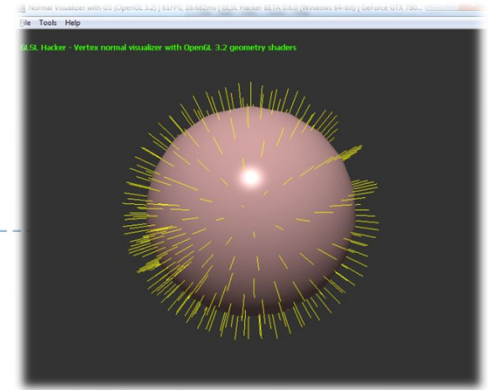

- ▶ OpenGL has an error state
- ▶ Use `glGetError()` to find location of error. It will clear the error flag.
- ▶ Then `gluErrorString()` to parse the error message

```
void printGLError(const char* msg)
{
    const GLenum err = glGetError();
    if(err != GL_NO_ERROR)
    {
        const char* str = (const char*)gluErrorString(err);
        cerr << "OpenGL error: " << msg << ", " << str << endl;
    }
}
```

# Tips for Visual Debugging

- ▶ Collisions, view frustum culling:
  - ▶ Show bounding boxes/spheres for all objects
- ▶ Problems with shading:
  - ▶ Display normal vectors on vertices as line segments pointing in the direction of the vector. Example: [Normal Visualizer](#) (pictured above).
  - ▶ Or interpret surface normals as RGB colors by shifting x/y/z range from -1..1 to 0..1.
- ▶ Display direction and other vectors:
  - ▶ Display normal vectors as described above.
- ▶ Objects don't get rendered:
  - ▶ Find out if they won't render or are just off screen by temporarily overwriting `GL_MODELVIEW` and `GL_PROJECTION` matrices with simpler ones, and/or zooming out by increasing the field of view angle.

### Normal Visualizer

*Normal shading*

# OpenGL Debugging Tools

---

- ▶ Overview with many links:
  - ▶ [https://www.opengl.org/wiki/Debugging\\_Tools](https://www.opengl.org/wiki/Debugging_Tools)
- ▶ Nvidia tools (Nsight and others):
  - ▶ <https://developer.nvidia.com/gameworks-tools-overview>
