CSE 167: Introduction to Computer Graphics

Lecture #9: Texture Mapping

Jürgen P. Schulze, Ph.D. University of California, San Diego Fall Quarter 2012

Announcements

- ▶ Homework assignment #4 due Friday, Nov 2nd
 - ▶ To be presented after 1:30pm in lab 260 (as usual)
 - No more late submissions accepted
- Homework #4 clarifications
 - Mouse controls should affect light coordinates as if they were 3d models.
 - All OpenGL functions can be used for this and all following homework assignments.
- Homework introduction for project #5:
 - Monday, 2:30pm in lab 260

Midterm Statistics

# Submissions	53
Average score	69.9
Median score	72.0
Highest score	95
Lowest score	38

Lecture Overview

- Texture Mapping
 - Overview
 - Wrapping
 - ▶ Texture coordinates
 - Anti-aliasing

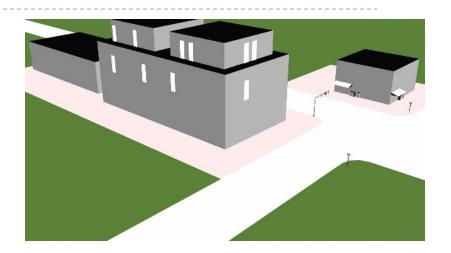

Large Triangles

Pros:

- Often sufficient for simple geometry
- ▶ Fast to render

Cons:

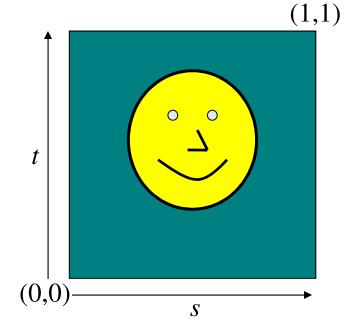

Per vertex colors look boring and computer-generated

- Map textures (images) onto surface polygons
- Same triangle count, much more realistic appearance

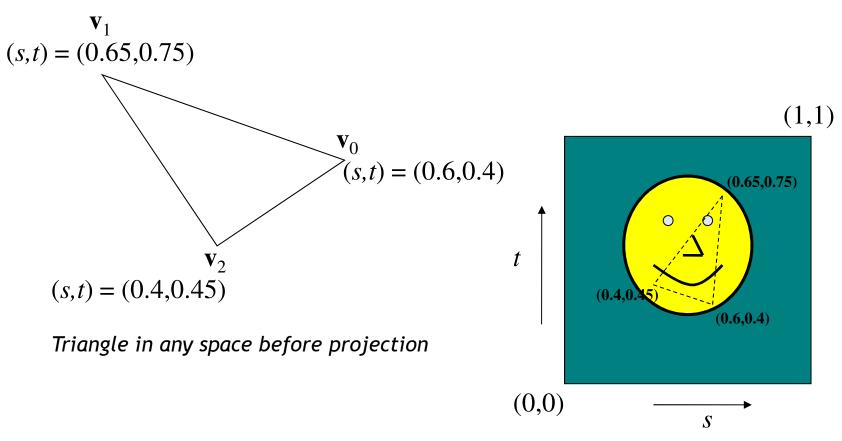

- Goal: map locations in texture to locations on 3D geometry
- ▶ Texture coordinate space
 - Texture pixels (texels) have texture coordinates (s,t)
- Convention
 - Bottom left corner of texture is at (s,t) = (0,0)
 - ▶ Top right corner is at (s,t) = (1,1)

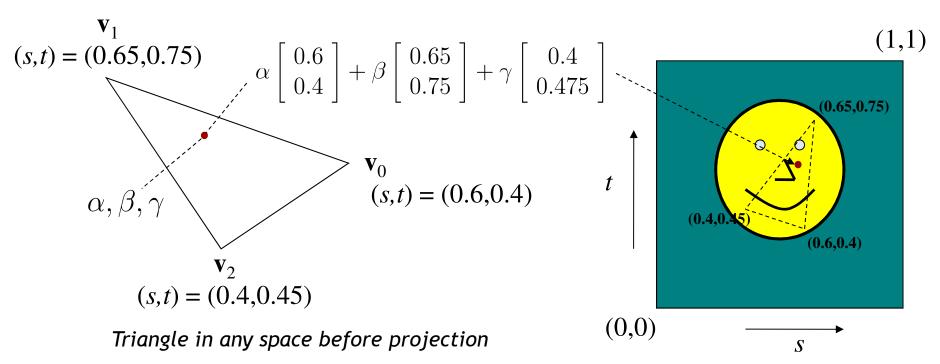

Texture coordinates

▶ Store 2D texture coordinates s,t with each triangle vertex

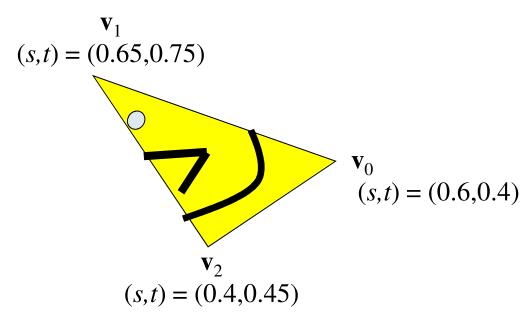

Texture coordinates

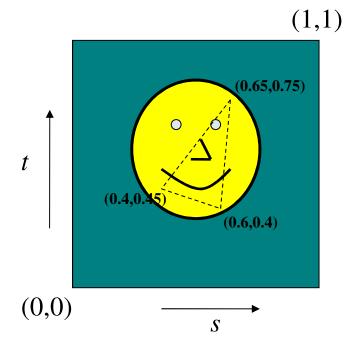

- Each point on triangle has barycentric coordinates α , β , γ
- Barycentric coordinates interpolate texture coordinates
- Done automatically on GPU

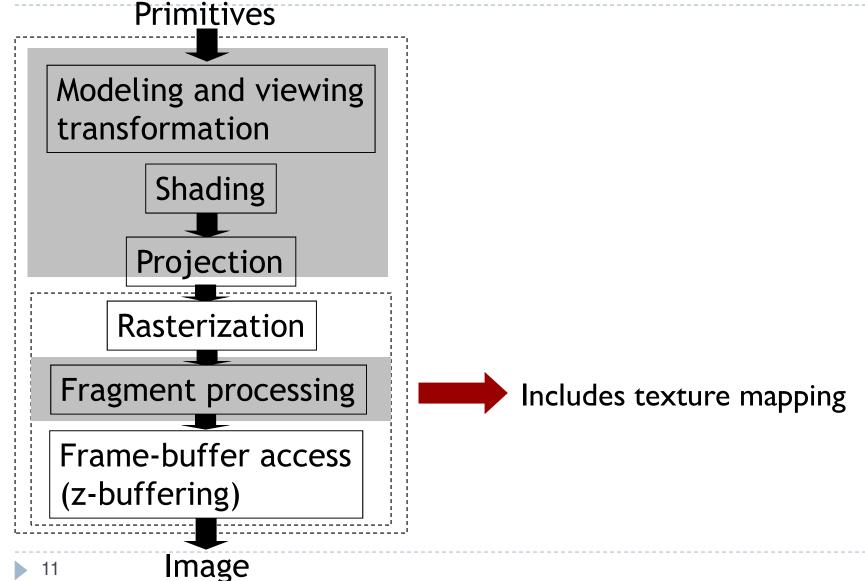

Each point on triangle gets color from its corresponding point in texture

Triangle in any space before projection

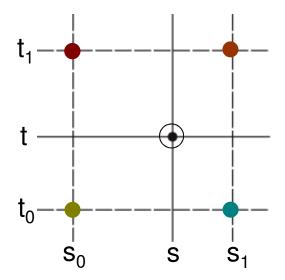

Texture coordinates

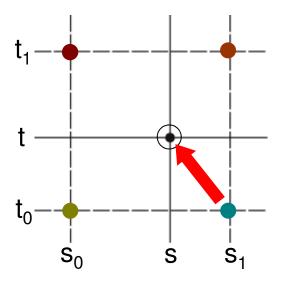

Texture Look-Up

- Given interpolated texture coordinates (s, t) at current pixel
- ► Closest four texels in texture space are at $(s_0,t_0), (s_1,t_0), (s_0,t_1), (s_1,t_1)$
- How to compute pixel color?

Nearest-Neighbor Interpolation

Use color of closest texel

Simple, but low quality and aliasing

Bilinear Interpolation

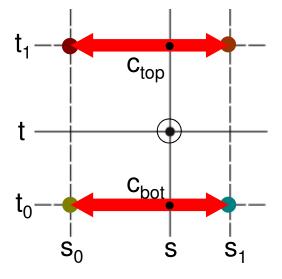

I. Linear interpolation horizontally:

Ratio in s direction r_s :

$$r_{s} = \frac{s - s_{0}}{s_{1} - s_{0}}$$

$$c_{top} = tex(s_{0}, t_{1}) (I - r_{s}) + tex(s_{1}, t_{1}) r_{s}$$

$$c_{bot} = tex(s_{0}, t_{0}) (I - r_{s}) + tex(s_{1}, t_{0}) r_{s}$$

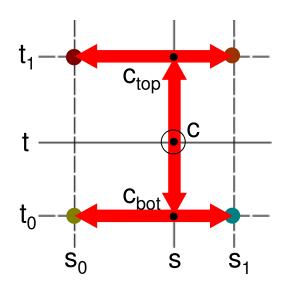

Bilinear Interpolation

2. Linear interpolation vertically

Ratio in t direction r_t :

$$r_{t} = \frac{t - t_{0}}{t_{1} - t_{0}}$$

$$c = c_{bot} (I - r_{t}) + c_{top} r_{t}$$

Lecture Overview

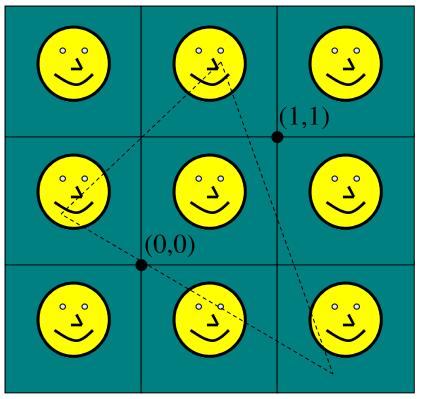

- Texture Mapping
 - Overview
 - Wrapping
 - Texture coordinates
 - Anti-aliasing

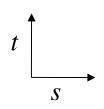

Wrap Modes

- ▶ Texture image extends from [0,0] to [1,1] in texture space
 - What if (s,t) texture coordinates are beyond that range?
- → Texture wrap modes

Repeat

- Repeat the texture
 - Creates discontinuities at edges
 - unless texture designed to line up

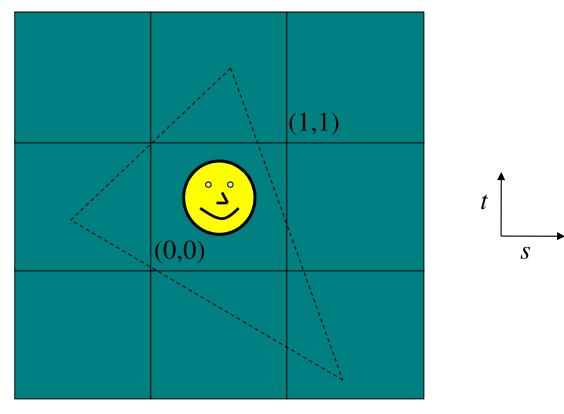

Seamless brick wall texture (by Christopher Revoir)

Clamp

- ▶ Use edge value everywhere outside data range [0..1]
- Or, ignore the texture outside [0..1]

Wrap Mode Specification in OpenGL

Default:

- glTexParameterf(GL_TEXTURE_2D, GL_TEXTURE_WRAP_S, GL_REPEAT);
- glTexParameterf(GL_TEXTURE_2D, GL_TEXTURE_WRAP_T, GL_REPEAT);

Options for wrap mode:

GL_CLAMP (requires border to be set)
 GL_CLAMP_TO_EDGE (repeats last pixel in texture),
 GL_REPEAT

Lecture Overview

- Texture Mapping
 - Overview
 - Wrapping
 - Texture coordinates
 - Anti-aliasing

Texture Coordinates

What if texture extends across multiple polygons?

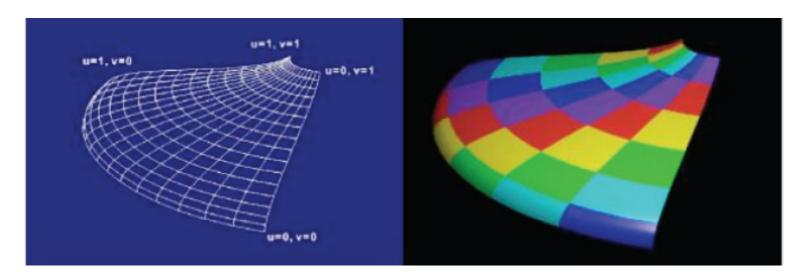

- → Surface parameterization
- Mapping between 3D positions on surface and 2D texture coordinates
 - Defined by texture coordinates of triangle vertices
- Options for mapping:
 - Parametric
 - Orthographic
 - Projective
 - Spherical
 - Cylindrical
 - Skin

Parametric Mapping

Surface given by parametric functions

$$x = f(u, v)$$
 $y = f(u, v)$ $z = f(u, v)$

- Very common in CAD
- ▶ Clamp (u,v) parameters to [0..1] and use as texture coordinates (s,t)

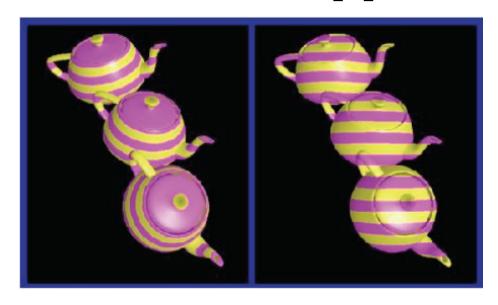

Orthographic Mapping

Use linear transformation of object's xyz coordinates

Example:

$$\begin{bmatrix} s \\ t \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix}$$

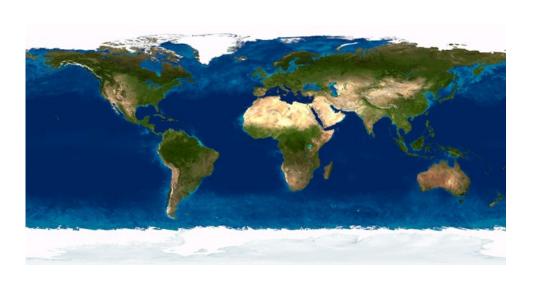

Projective Mapping

- Use perspective projection of xyz coordinates
 - OpenGL provides GL_TEXTURE matrix to apply on texture coordinates
- Can be used for "fake" lighting effects

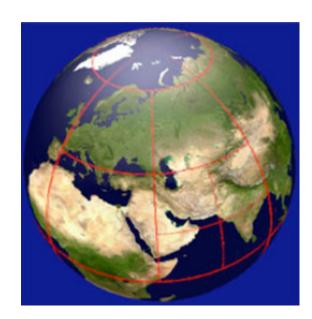

Spherical Mapping

- Use spherical coordinates
- "Shrink-wrap" sphere to object

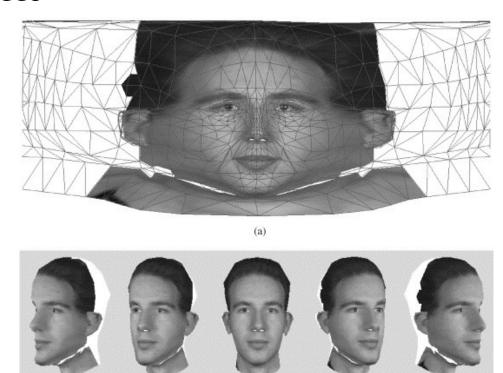

Texture map

Mapping result

Cylindrical Mapping

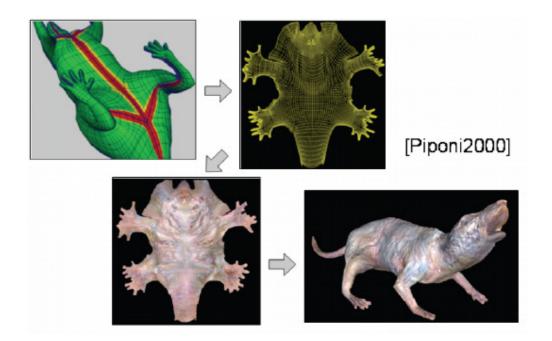

- Similar to spherical mapping, but with cylindrical coordinates
- Useful for faces

Source: "Facial model adaptation from a monocular image sequence using a textured polygonal model", Chang et al. 2002

Skin Mapping

- Complex technique to unfold surface onto plane
- Unfolding mathematics must be done backwards when texture mapping

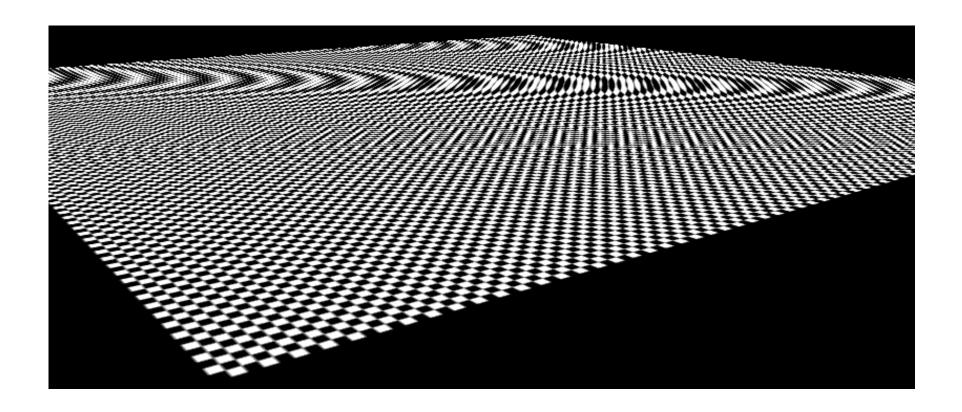

Lecture Overview

- Texture Mapping
 - Overview
 - Wrapping
 - Texture coordinates
 - Anti-aliasing

Aliasing

What could cause this aliasing effect?

Aliasing

Sufficiently sampled, no aliasing

Insufficiently sampled, aliasing

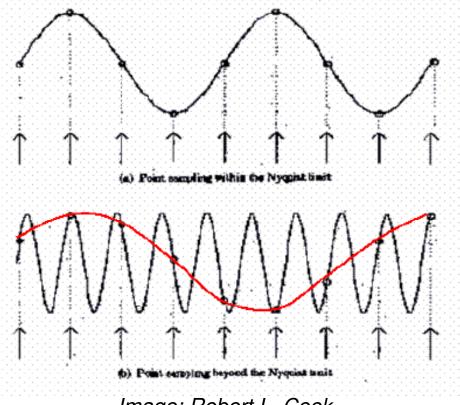

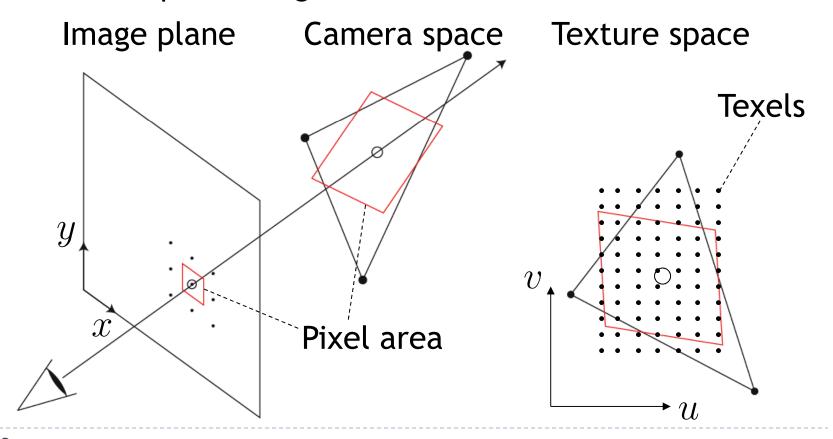

Image: Robert L. Cook

High frequencies in the input data can appear as lower frequencies in the sampled signal

Antialiasing: Intuition

- ▶ Pixel may cover large area on triangle in camera space
- Corresponds to many texels in texture space
- Need to compute average

Antialiasing Using Mip-Maps

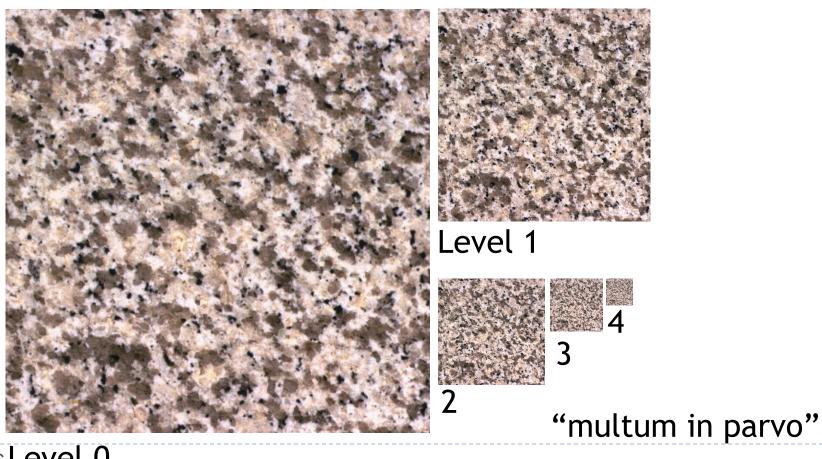

- Averaging over texels is expensive
 - Many texels as objects get smaller
 - Large memory access and computation cost
- Precompute filtered (averaged) textures
 - Mip-maps
- Practical solution to aliasing problem
 - Fast and simple
 - Available in OpenGL, implemented in GPUs
 - Reasonable quality

MIP stands for multum in parvo = "much in little" (Williams 1983)

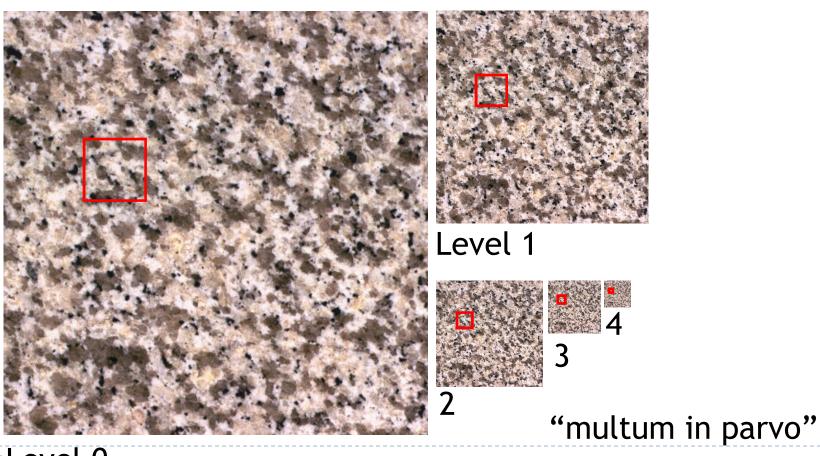

Before rendering

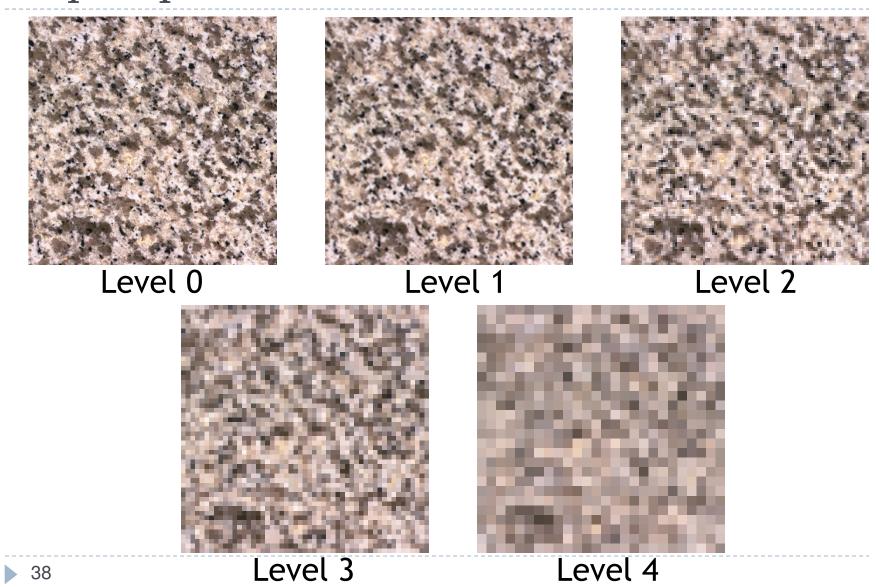

- Pre-compute and store down scaled versions of textures
 - Reduce resolution by factors of two successively
 - Use high quality filtering (averaging) scheme
- Increases memory cost by 1/3
 - $| 1/3 = \frac{1}{4} + \frac{1}{16} + \frac{1}{64} + \dots$
- Width and height of texture should be powers of two (nonpower of two supported since OpenGL 2.0)

Example: resolutions 512x512, 256x256, 128x128, 64x64, 32x32 pixels

One texel in level 4 is the average of 4⁴=256 texels in level 0

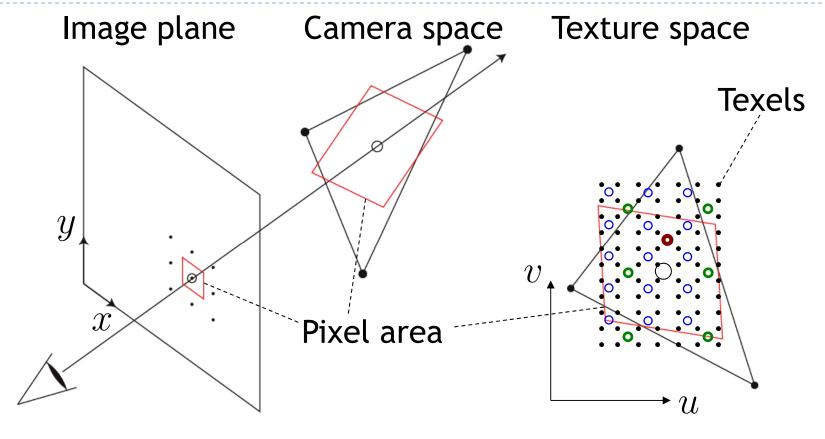

Rendering With Mipmaps

- "Mipmapping"
- Interpolate texture coordinates of each pixel as without mipmapping
- Compute approximate size of pixel in texture space
- Look up color in nearest mipmap
 - ▶ E.g., if pixel corresponds to 10x10 texels use mipmap level 3
 - Use nearest neighbor or bilinear interpolation as before

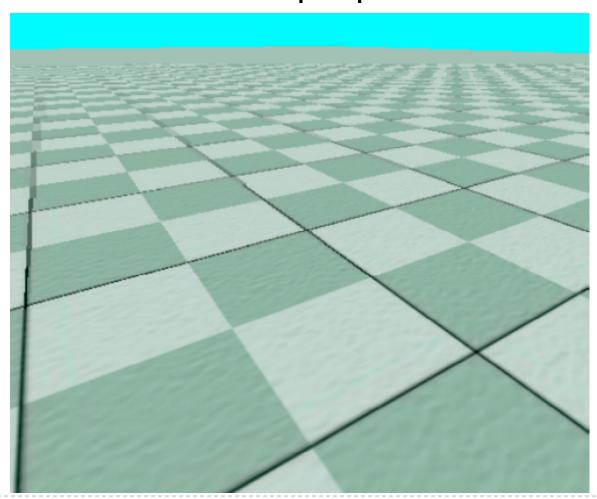

Mipmapping

- · Mip-map level 0
- Mip-map level 1
- Mip-map level 2
- Mip-map level 3

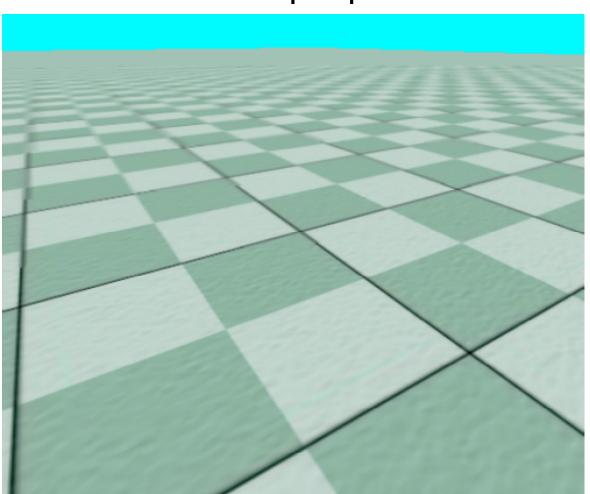

Nearest Mipmap, Nearest Neighbor

Visible transition between mipmap levels

Nearest Mipmap, Bilinear

Visible transition between mipmap levels

Trilinear Mipmapping

- Use two nearest mipmap levels
 - E.g., if pixel corresponds to 10x10 texels, use mipmap levels 3 (8x8) and 4 (16x16)
- ▶ 2-Step approach:
 - Step I: perform bilinear interpolation in both mip-maps
 - Step 2: linearly interpolate between the results
- Requires access to 8 texels for each pixel
- Supported by hardware without performance penalty
