

CSE 167:  
Introduction to Computer Graphics  
Lecture #15: Procedural Modeling

Jürgen P. Schulze, Ph.D.  
University of California, San Diego  
Fall Quarter 2018

# Announcements

---

- ▶ Final project is on-line
  - ▶ 3 blog post deadlines, first one due next Tuesday
- ▶ Discussion topics tomorrow:
  - ▶ Final Project
  - ▶ Midterm #2
- ▶ Midterm #2 next Thursday in class
- ▶ Project 4 late grading next Friday at 2pm

# Lecture Overview

---

- ▶ Procedural Modeling
  - ▶ Concepts
  - ▶ Algorithms

# 3D Modeling

---

- ▶ Creating 3D objects/scenes and defining their appearance (texture, etc.)
- ▶ So far we created
  - ▶ Triangle meshes
  - ▶ Bezier patches
- ▶ Interactive modeling
  - ▶ Place vertices, control points manually
- ▶ For realistic scenes, we need extremely complex models containing millions or billions of primitives

# Alternatives

---

- ▶ **Data-driven modeling**

- ▶ Scan model geometry from real world examples
- ▶ Use laser scanners or similar devices
- ▶ Use photographs as textures

Photograph

Rendering

[Levoy et al.]

- ▶ **Procedural modeling**

- ▶ Construct 3D models and/or textures algorithmically

# Procedural Modeling

---

- ▶ Wide variety of techniques for algorithmic model creation
- ▶ Used to create models too complex (or tedious) to build manually
  - ▶ Terrain, clouds
  - ▶ Plants, ecosystems
  - ▶ Buildings, cities
- ▶ Usually defined by a small set of data, or rules, that describes the overall properties of the model
  - ▶ Example: tree defined by branching properties and leaf shapes
- ▶ Model is constructed by an algorithm
  - ▶ Often includes randomness to add variety
  - ▶ E.g., a single tree pattern can be used to model an entire forest

[Deussen et al.]

# Randomness

---

- ▶ Use some sort of randomness to make models more interesting, natural, less uniform
- ▶ *Pseudorandom* number generation algorithms
  - ▶ Produce a sequence of (apparently) random numbers based on some initial seed value
  - ▶ `rand()` generates random number between 0 and 1
- ▶ Pseudorandom sequences are repeatable, as one can always reset the sequence
  - ▶ `srand(seed)` initializes the random number generator
  - ▶ If the seed value is changed, a different sequence of numbers will be generated
  - ▶ Non-repeatable sequences can be generated with `srand( (unsigned)time(NULL) );`

# Lecture Overview

---

- ▶ Procedural Modeling
  - ▶ Concepts
  - ▶ Algorithms

# Height Fields

# Height Fields

---

- ▶ Landscapes are often constructed as *height fields*
- ▶ Regular grid on the ground plane
- ▶ Store a height value at each point
- ▶ Can store large terrain in memory
  - ▶ No need to store all grid coordinates: inherent connectivity
- ▶ Shape terrain by operations that modify the height at each grid point
- ▶ Can generate height from grey scale values
  - ▶ Allows using image processing tools to create terrain height

# Midpoint Displacement Algorithm

## ► Random midpoint displacement algorithm (one-dimensional)

```
Start with single horizontal line segment.  
Repeat for sufficiently large number of times  
{  
  Repeat over each line segment in scene  
  {  
    Find midpoint of line segment.  
    Displace midpoint in Y by random amount.  
    Reduce range for random numbers.  
  }  
}
```

## ► Similar for triangles, quadrilaterals

Step 0

Step 1

Step 2

Step 3

Result: Mountain Range

# Diamond Square Algorithm

- ▶ Begins with a 2D array of size  $2^n + 1$
- ▶ Four corner points must be set to initial values.
- ▶ Perform diamond and square steps alternately:
  - ▶ The diamond step: for each square in the array, set the midpoint of that square to be the average of the four corner points plus a random value.
  - ▶ The square step: for each diamond in the array, set the midpoint of that diamond to be the average of the four corner points plus a random value.
  - ▶ Points located on edges of the array will have only three adjacent values set rather than four: take their average.
- ▶ At each iteration, the magnitude of the random value should be reduced.

# Diamond Square Algorithm: Video

---

- ▶ <https://www.youtube.com/watch?v=9HJKrctqIJl>

# Fractals

# Fractals

- ▶ **Fractal:**  
Fragmented geometric shape which can be split into parts, each of which is (at least approximately) a smaller size copy of the whole
- ▶ **Self-similarity**

From Wikipedia

# Mandelbrot Set

- ▶  $Z$  and  $C$  are complex numbers
- ▶ Initialize  $Z$  with  $0+0i$
- ▶ Pick any  $C$

$$Z_{\text{new}} = Z_{\text{old}}^2 + C$$

- ▶ If  $C$  is diverting to infinity it is not part of the Mandelbrot set
- ▶ Otherwise it is

# Mandelbrot Set: Video

---

- ▶ The Hardest Mandelbrot Zoom in 2017 –  
New record, 750 000 000 iterations
- ▶ [https://www.youtube.com/watch?v=aSg2Db3jF\\_4](https://www.youtube.com/watch?v=aSg2Db3jF_4)

# Mandelbox

---

- ▶ A fractal with a boxlike shape found by Tom Lowe in 2010
- ▶ Defined in a similar way to the Mandelbrot set
- ▶ Can be defined in any number of dimensions, typically drawn in three dimensions for illustrative purposes
- ▶ Video
  - ▶ <http://www.youtube.com/watch?v=0clz6WLFWaY>

# Real-Time Fractal Rendering

---

- ▶ Trip inside a 3D fractal (Kleinian) GPU realtime rendering
  - ▶ <https://www.youtube.com/watch?v=XIzScwydxOE>

# Fractal Landscapes

---

- ▶ Add textures, material properties; use nice rendering algorithm
- ▶ Example: Terragen Classic (free software)  
<http://www.planetside.co.uk/terrigen/>

[<http://www.planetside.co.uk/gallery/f/tg09>]

# L-Systems

# L-Systems

---

- ▶ Developed by biologist Aristid Lindenmayer in 1968 to study growth patterns of algae
- ▶ Defined by grammar

$$G = \{V, S, \omega, P\}$$

- ▶  $V$  = alphabet, set of symbols that can be replaced (variables)
- ▶  $S$  = set of symbols that remain fixed (constants)
- ▶  $\omega$  = string of symbols defining initial state
- ▶  $P$  = production rules
- ▶ **Stochastic L-system**
  - ▶ If there is more than one production rule for a symbol, randomly choose one

# Turtle Interpretation for L-Systems

---

- ▶ Origin: functional programming language Logo
  - ▶ Dialect of Lisp
  - ▶ Designed for education: drove a mechanical turtle as an output device
- ▶ Turtle interpretation of strings
  - ▶ State of turtle defined by  $(x, y, \alpha)$  for position and heading
  - ▶ Turtle moves by step size  $d$  and angle increment  $\delta$
- ▶ Sample Grammar
  - ▶ F: move forward a step of length  $d$   
New turtle state:  $(x', y', \alpha)$   
$$x' = x + d \cos \alpha$$
$$y' = y + d \sin \alpha$$
A line segment between points  $(x, y)$  and  $(x', y')$  is drawn.
  - ▶ +: Turn left by angle  $\delta$ . Next state of turtle is  $(x, y, \alpha + \delta)$   
Positive orientation of angles is counterclockwise.
  - ▶ -: Turn right by angle  $\delta$ . Next state of turtle is  $(x, y, \alpha - \delta)$

# Example: Sierpinski Triangle

- ▶ **Variables:** A, B
  - ▶ Draw forward
- ▶ **Constants:** + , -
  - ▶ Turn left, right by 60 degrees
- ▶ **Start:** A
- ▶ **Rules:**  $(A \rightarrow B-A-B)$ ,  $(B \rightarrow A+B+A)$

2 iterations

4 iterations

6 iterations

9 iterations

# Example: Fern

---

- ▶ **Variables:** X, F
  - ▶ X: no drawing operation
  - ▶ F: move forward
- ▶ **Constants:** +, -
  - ▶ Turn left, right
- ▶ **Start:** X
- ▶ **Rules:**  
 $(X \rightarrow F - [[X] + X] + F[+FX] - X), (F \rightarrow FF)$

[Wikipedia]

# Demo

► <http://www.kevs3d.co.uk/dev/lsystems/>

Iterations: 5 ☐ Auto Line Width

Angle: 22

Constants:

Axoin: F

Rule1:  $F=COFF-(C1-F+F+F)+(C2+F-F-F)$

Rule2:

Rule3:

Rule4:

Rule5:

Start

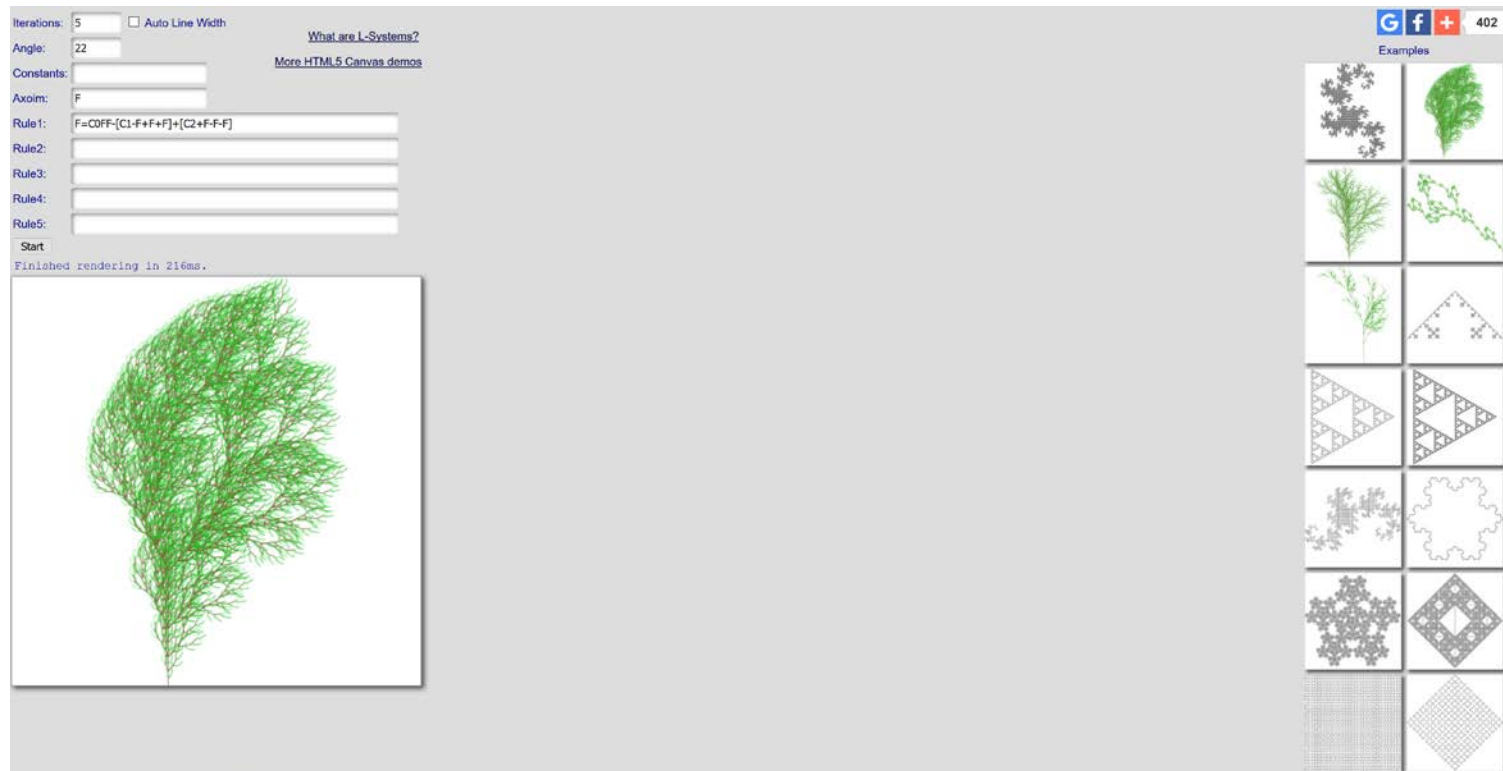

Finished rendering in 216ms.

G f + 402

Examples

The screenshot displays a web-based L-system demo interface. On the left, there is a control panel with input fields for 'Iterations' (set to 5), 'Angle' (set to 22), 'Constants', 'Axoin' (set to 'F'), and five 'Rule' fields. The first rule is populated with the expression  $F=COFF-(C1-F+F+F)+(C2+F-F-F)$ . Below these fields is a 'Start' button and a status message 'Finished rendering in 216ms.'. To the right of the controls is a large rectangular canvas displaying a complex, branching green fractal tree. On the far right, there is a vertical sidebar titled 'Examples' containing a 4x4 grid of 16 small thumbnail images. These thumbnails show various different L-system generated patterns, including different types of trees, snowflakes, and geometric fractals. At the top of this sidebar, there are social media icons for Google+, Facebook, and Twitter, along with a user count of 402.

# Fractal Trees
