

CSE 167:  
Introduction to Computer Graphics  
Lecture #5: Illumination Model

Jürgen P. Schulze, Ph.D.  
University of California, San Diego  
Spring Quarter 2016

# Announcements

---

- ▶ Project 2 due next Friday at 2pm

# Shading

---

- ▶ Compute interaction of light with surfaces
- ▶ Requires simulation of physics
- ▶ “Global illumination”
  - ▶ Multiple bounces of light
  - ▶ Computationally expensive, minutes per image
  - ▶ Used in movies, architectural design, etc.

# Global Illumination

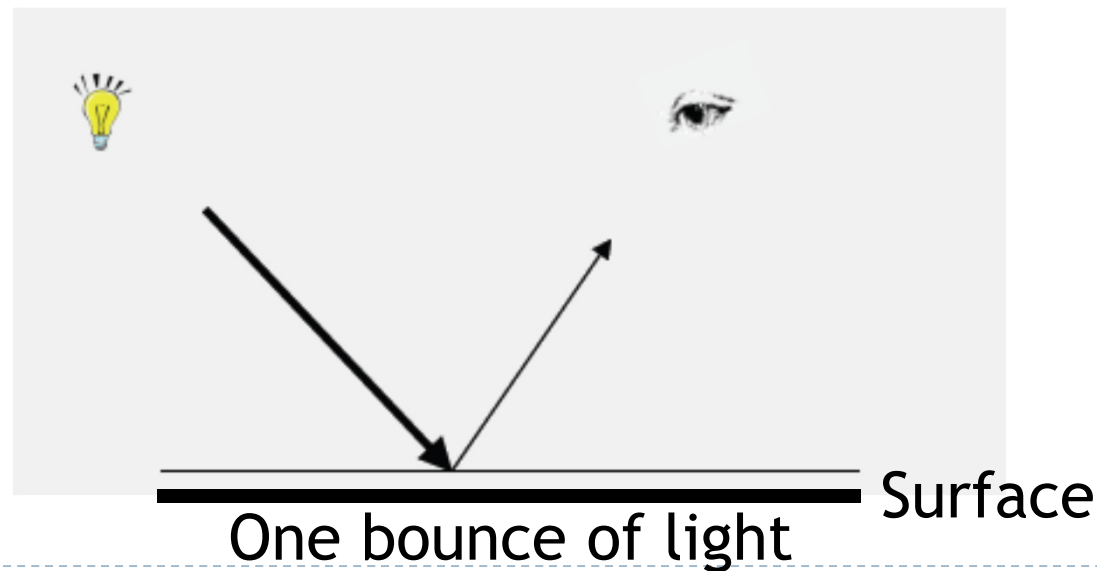

---

# Interactive Applications

---

- ▶ No physics-based simulation
- ▶ Simplified models
- ▶ Reproduce perceptually most important effects
- ▶ Local illumination
  - ▶ Only one bounce of light between light source and viewer

# Rendering Pipeline

- Position object in 3D
- Determine colors of vertices
  - Per vertex shading
- Map triangles to 2D
- Draw triangles
  - Per pixel shading

# Lecture Overview

---

- ▶ OpenGL's local shading model

# Local Illumination

- ▶ What gives a material its color?
- ▶ How is light reflected by a
  - ▶ Mirror
  - ▶ White sheet of paper
  - ▶ Blue sheet of paper
  - ▶ Glossy metal

# Local Illumination

---

- ▶ **Model reflection of light at surfaces**
  - ▶ Assumption: no subsurface scattering
- ▶ **Bidirectional reflectance distribution function (BRDF)**
  - ▶ Given light direction, viewing direction, how much light is reflected towards the viewer
  - ▶ For any pair of light/viewing directions!

# Local Illumination

---

## Simplified model

- ▶ Sum of 3 components
- ▶ Covers a large class of real surfaces

# Local Illumination

---

## Simplified model

- ▶ Sum of 3 components
- ▶ Covers a large class of real surfaces

# Diffuse Reflection

---

- ▶ Ideal diffuse material reflects light equally in all directions
- ▶ View-independent
- ▶ Matte, not shiny materials
  - ▶ Paper
  - ▶ Unfinished wood
  - ▶ Unpolished stone

# Diffuse Reflection

- ▶ Beam of parallel rays shining on a surface
  - ▶ Area covered by beam varies with the angle between the beam and the normal
  - ▶ The larger the area, the less incident light per area
  - ▶ Incident light per unit area is proportional to the cosine of the angle between the normal and the light rays
- ▶ Object darkens as normal turns away from light
- ▶ Lambert's cosine law (Johann Heinrich Lambert, 1760)
- ▶ Diffuse surfaces are also called Lambertian surfaces

# Diffuse Reflection

---

## ▶ Given

- ▶ Unit surface normal  $\mathbf{n}$
- ▶ Unit light direction  $\mathbf{L}$
- ▶ Material diffuse reflectance (material color)  $k_d$
- ▶ Light color (intensity)  $c_l$

## ▶ Diffuse color $c_d$ is:

$$c_d = c_l k_d (\mathbf{n} \cdot \mathbf{L})$$

Proportional to cosine  
between normal and light

# Diffuse Reflection

---

## Notes

- ▶ Parameters  $k_d, c_l$  are r,g,b vectors
- ▶ Need to compute r,g,b values of diffuse color  $c_d$  separately
- ▶ Parameters in this model have no precise physical meaning
  - ▶  $c_l$ : strength, color of light source
  - ▶  $k_d$ : fraction of reflected light, material color

# Diffuse Reflection

---

- ▶ Provides visual cues
  - ▶ Surface curvature
  - ▶ Depth variation

Lambertian (diffuse) sphere under different lighting directions

# OpenGL

---

- ▶ **Lights (glLight\*)**
  - ▶ Values for light:  $(0, 0, 0) \leq c_l \leq (1, 1, 1)$
  - ▶ Definition: (0,0,0) is black, (1,1,1) is white
- ▶ **OpenGL**
  - ▶ Values for diffuse reflection
  - ▶ Fraction of reflected light:  $(0, 0, 0) \leq k_d \leq (1, 1, 1)$
- ▶ **Consult OpenGL Programming Guide (Red Book)**
  - ▶ See course web site

# Local Illumination

---

## Simplified model

- ▶ Sum of 3 components
- ▶ Covers a large class of real surfaces

# Specular Reflection

---

- ▶ **Shiny surfaces**
  - ▶ Polished metal
  - ▶ Glossy car finish
  - ▶ Plastics
- ▶ **Specular highlight**
  - ▶ Blurred reflection of the light source
  - ▶ Position of highlight depends on viewing direction

Specular highlight

# Specular Reflection

---

- ▶ Ideal specular reflection is mirror reflection
  - ▶ Perfectly smooth surface
  - ▶ Incoming light ray is bounced in single direction
  - ▶ Angle of incidence equals angle of reflection

# Law of Reflection

- ▶ Angle of incidence equals angle of reflection

$$\vec{\mathbf{R}} + \vec{\mathbf{L}} = 2 \cos \theta \vec{\mathbf{n}} = 2(\vec{\mathbf{L}} \cdot \vec{\mathbf{n}})\vec{\mathbf{n}}$$

$$\vec{\mathbf{R}} = 2(\vec{\mathbf{L}} \cdot \vec{\mathbf{n}})\vec{\mathbf{n}} - \vec{\mathbf{L}}$$

# Specular Reflection

---

- ▶ Many materials are not perfect mirrors
  - ▶ Glossy materials

Glossy teapot

# Glossy Materials

---

- ▶ Assume surface composed of small mirrors with random orientation (micro-facets)
- ▶ Smooth surfaces
  - ▶ Micro-facet normals close to surface normal
  - ▶ Sharp highlights
- ▶ Rough surfaces
  - ▶ Micro-facet normals vary strongly
  - ▶ Blurry highlight

Polished

Smooth

Rough

Very rough

# Glossy Surfaces

---

- ▶ Expect most light to be reflected in mirror direction
- ▶ Because of micro-facets, some light is reflected slightly off ideal reflection direction
- ▶ Reflection
  - ▶ Brightest when view vector is aligned with reflection
  - ▶ Decreases as angle between view vector and reflection direction increases

# Phong Shading Model

- ▶ Developed by Bui Tuong Phong in 1973
- ▶ Specular reflectance coefficient  $k_s$
- ▶ Phong exponent  $p$ 
  - ▶ Greater  $p$  means smaller (sharper) highlight

$$c = k_s c_l (\mathbf{R} \cdot \mathbf{e})^p$$

# Phong Shading Model

# Blinn Shading Model (Jim Blinn, 1977)

- ▶ Modification of Phong Shading Model

- ▶ Defines unit halfway vector  $\mathbf{h} = \frac{\mathbf{L} + \mathbf{e}}{\|\mathbf{L} + \mathbf{e}\|}$

- ▶ Halfway vector represents normal of micro-facet that would lead to mirror reflection to the eye

# Blinn Shading Model

- ▶ The larger the angle between micro-facet orientation and normal, the less likely
- ▶ Use cosine of angle between them
- ▶ Shininess parameter  $s$
- ▶ Very similar to Phong Model

$$c = k_s c_l (\mathbf{h} \cdot \mathbf{n})^s$$

# Local Illumination

---

## Simplified model

- ▶ Sum of 3 components
- ▶ Covers a large class of real surfaces

# Ambient Light

---

- ▶ In real world, light is bounced all around scene
- ▶ Could use global illumination techniques to simulate
- ▶ Simple approximation
  - ▶ Add constant ambient light at each point:  $k_a c_a$
  - ▶ Ambient light color:  $c_a$
  - ▶ Ambient reflection coefficient:  $k_a$
- ▶ Areas with no direct illumination are not completely dark

# Complete Blinn-Phong Shading Model

- ▶ Blinn-Phong model with several light sources  $I$
- ▶ All colors and reflection coefficients are vectors with 3 components for red, green, blue

$$c = \sum_i c_{l_i} (k_d (\mathbf{L}_i \cdot \mathbf{n}) + k_s (\mathbf{h}_i \cdot \mathbf{n})^s) + k_a c_a$$

# Lecture Overview

---

- ▶ **OpenGL Light Sources**
  - ▶ Directional Lights
  - ▶ Point Lights
  - ▶ Spot Lights

# Light Sources

---

- ▶ Real light sources can have complex properties
  - ▶ Geometric area over which light is produced
  - ▶ Anisotropy (directionally dependent)
  - ▶ Reflective surfaces act as light sources (indirect light)

- ▶ OpenGL uses a drastically simplified model to allow real-time rendering

# OpenGL Light Sources

---

- ▶ At each point on surfaces we need to know
  - ▶ Direction of incoming light (the  $\mathbf{L}$  vector)
  - ▶ Intensity of incoming light (the  $c_i$  values)
- ▶ Standard light sources in OpenGL
  - ▶ **Directional**: from a specific direction
  - ▶ **Point light source**: from a specific point
  - ▶ **Spotlight**: from a specific point with intensity that depends on direction

# Lecture Overview

---

- ▶ **OpenGL Light Sources**
  - ▶ Directional Lights
  - ▶ Point Lights
  - ▶ Spot Lights

# Directional Light

- ▶ Light from a distant source
  - ▶ Light rays are parallel
  - ▶ Direction and intensity are the same everywhere
  - ▶ As if the source were infinitely far away
  - ▶ Good approximation of sunlight
- ▶ Specified by a unit length direction vector, and a color

$c_{src}$

Light source

$\mathbf{d}$

$c_l$

$\mathbf{L}$

$\mathbf{n}$

Receiving surface

$$\mathbf{L} = -\mathbf{d}$$

$$c_l = c_{src}$$

# Lecture Overview

---

- ▶ **OpenGL Light Sources**
  - ▶ Directional Lights
  - ▶ **Point Lights**
  - ▶ Spot Lights

# Point Lights

---

- ▶ Similar to light bulbs
- ▶ Infinitely small point radiates light equally in all directions
  - ▶ Light vector varies across receiving surface
  - ▶ What is light intensity over distance proportional to?
  - ▶ Intensity drops off proportionally to the inverse square of the distance from the light
    - ▶ Reason for inverse square falloff:  
Surface area  $A$  of sphere:  
 $A = 4 \pi r^2$

# Point Lights in Theory

At any point  $\mathbf{v}$  on the surface:

$$\mathbf{L} = \frac{\mathbf{p} - \mathbf{v}}{\|\mathbf{p} - \mathbf{v}\|}$$
$$c_l = \frac{c_{src}}{\|\mathbf{p} - \mathbf{v}\|^2}$$

# Point Lights in OpenGL

---

- ▶ OpenGL model for distance attenuation:

$$c_l = \frac{c_{src}}{k_c + k_l |\mathbf{p} - \mathbf{v}| + k_q |\mathbf{p} - \mathbf{v}|^2}$$

- ▶ Attenuation parameters:
  - ▶  $k_c$  = constant attenuation, default: 1
  - ▶  $k_l$  = linear attenuation, default: 0
  - ▶  $k_q$  = quadratic attenuation, default: 0
- ▶ Default: no attenuation:  $c_l = c_{src}$
- ▶ Change attenuation parameters with:
  - ▶ `GL_CONSTANT_ATTENUATION`
  - ▶ `GL_LINEAR_ATTENUATION`
  - ▶ `GL_QUADRATIC_ATTENUATION`

# Lecture Overview

---

- ▶ **OpenGL Light Sources**
  - ▶ Directional Lights
  - ▶ Point Lights
  - ▶ **Spot Lights**

# Spotlights

---

- ▶ Like point source, but intensity depends on direction

## Parameters

- ▶ Position: location of light source
- ▶ Spot direction: center axis of light source
- ▶ Falloff parameters:
  - ▶ Beam width (cone angle)
  - ▶ The way the light tapers off at the edges of the beam (cosine exponent)

# Spotlights

$$\mathbf{L} = \frac{\mathbf{p} - \mathbf{v}}{\|\mathbf{p} - \mathbf{v}\|}$$

$$c_l = \begin{cases} 0 & \text{if } -\mathbf{L} \cdot \mathbf{d} \leq \cos(\theta_{max}) \\ c_{src} (-\mathbf{L} \cdot \mathbf{d})^f & \text{otherwise} \end{cases}$$

# Spotlights
