CSE 190: 3D User Interaction

Lecture #9: Travel

Jürgen P. Schulze, Ph.D.

Announcements

- Homework assignment #3 due Friday, February 22nd at 1pm in Sequoia lab 142
  - Grading starts at 12:30
- Reminder: paper presentations
  - Next lecture:
    - Velu: Touché: Enhancing Touch Interaction on Humans, Screens, Liquids, and Everyday Objects
    - Haronid: D-Flow: Immersive Virtual Reality and Real-Time Feedback for Rehabilitation
    - Amell: Lightweight Palm and Finger Tracking for Real-Time 3D Gesture Control

Paper Presentations

- Today:
  - Vivek: Olfactory feedback system to improve the concentration level based on biological information
  - Joey: TBD
  - Matteo: A discussion of cybersickness in virtual environments

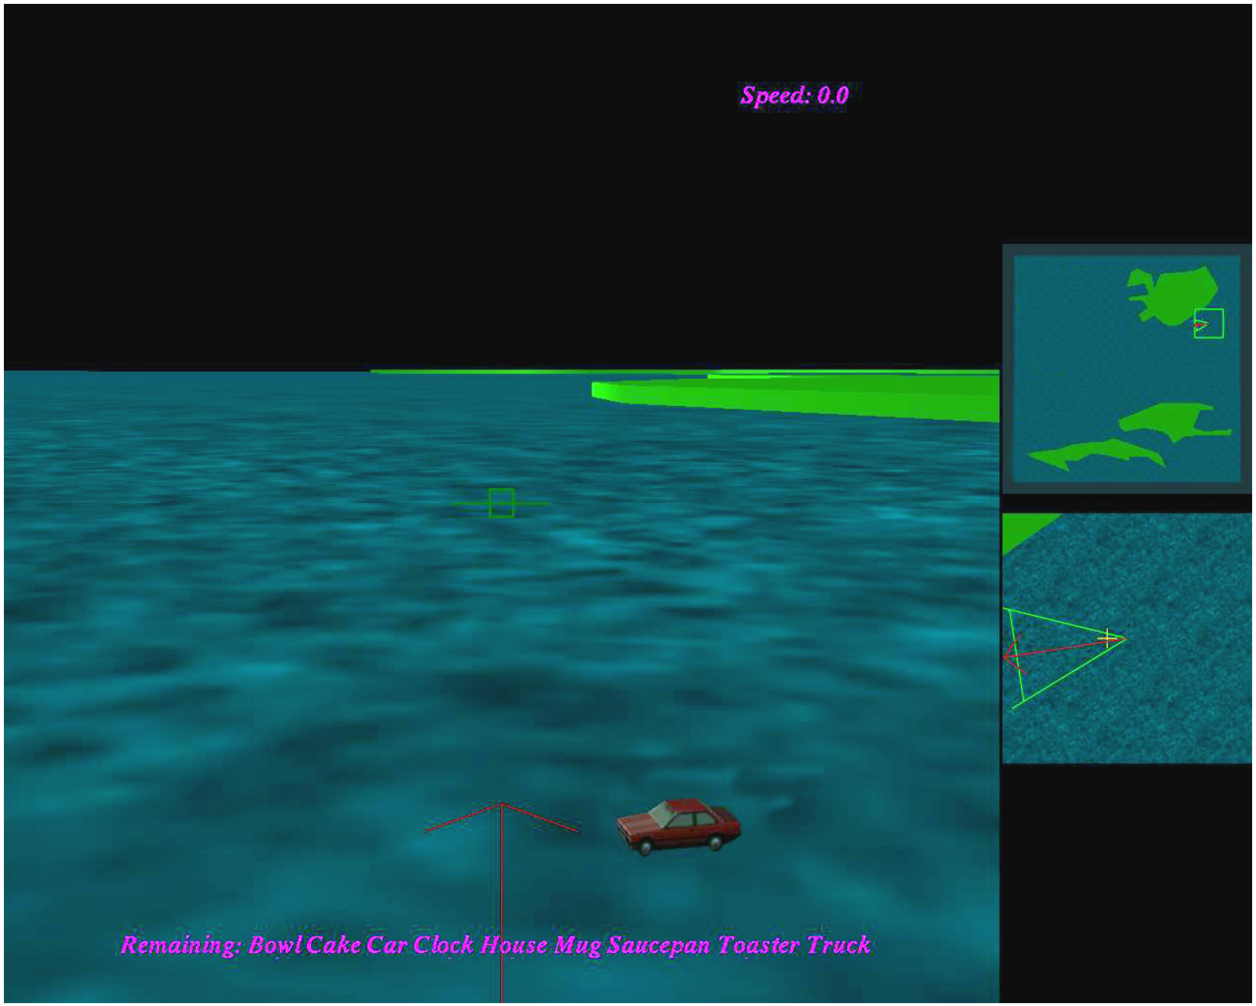
Navigation

Wayfinding – Cognitive Component

Artificial Cues

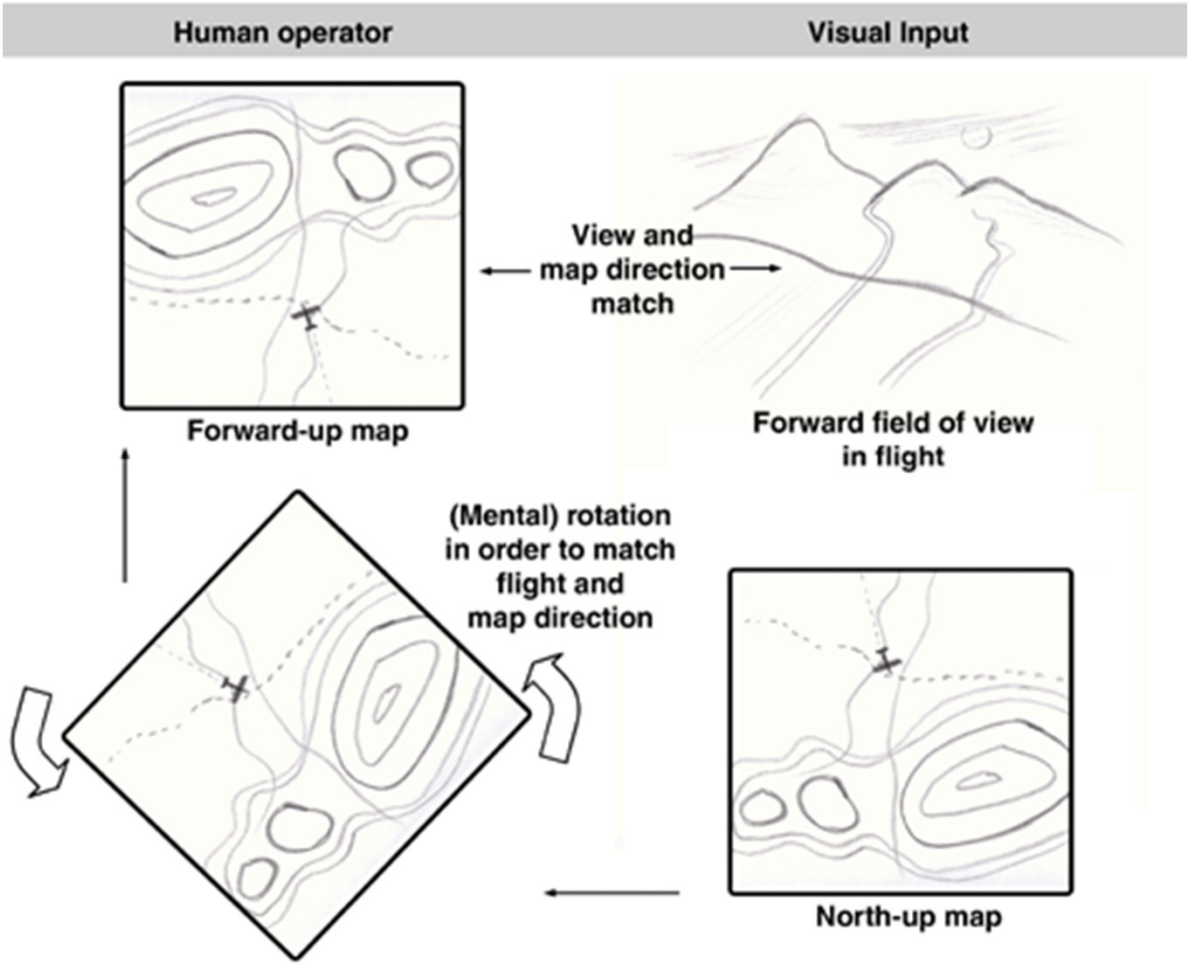
- Maps
- Compasses
- Signs
- Reference objects
- Artificial landmarks
- Trails

Maps (1)



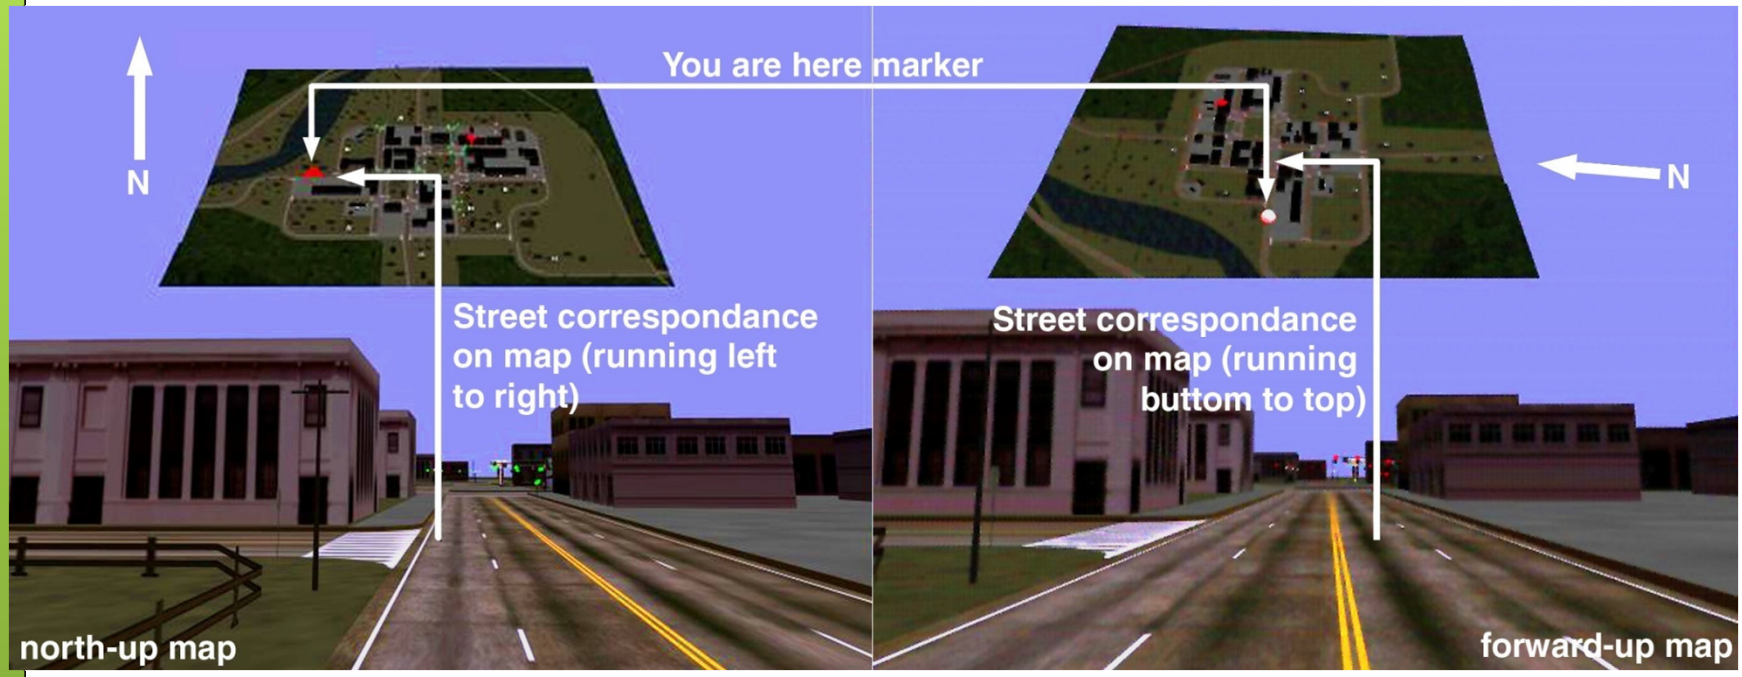
Speed: 0.0
Remaining: Bowl Cake Car Clock House Mug Saucepan Toaster Truck

Maps (2)



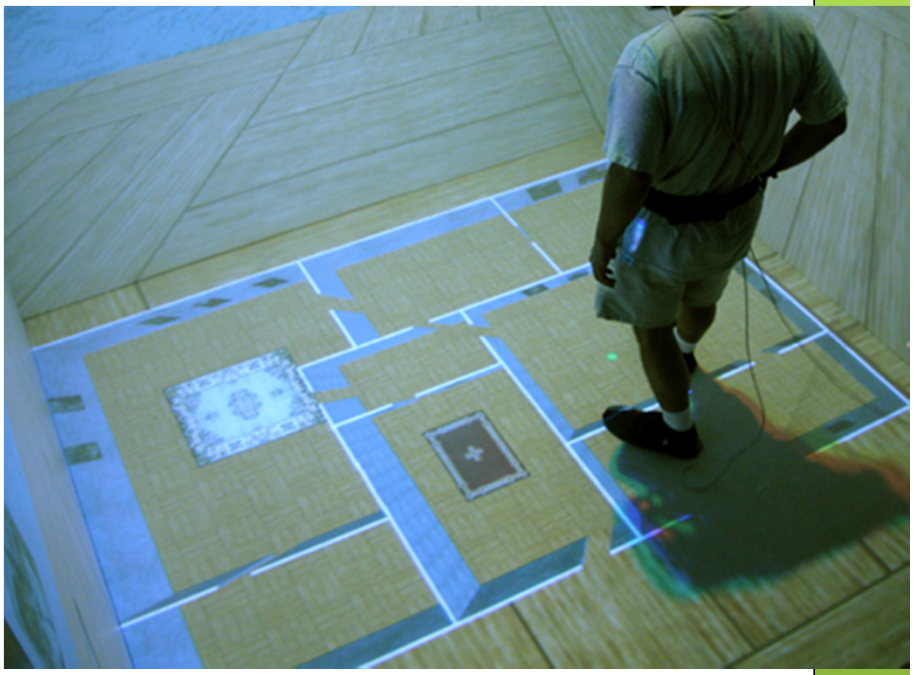
Human operator
Visual Input
View and
map direction
match
Forward-up map
Forward field of view
in flight
(Mental) rotation
in order to match
flight and
map direction
North-up map

Maps (3)

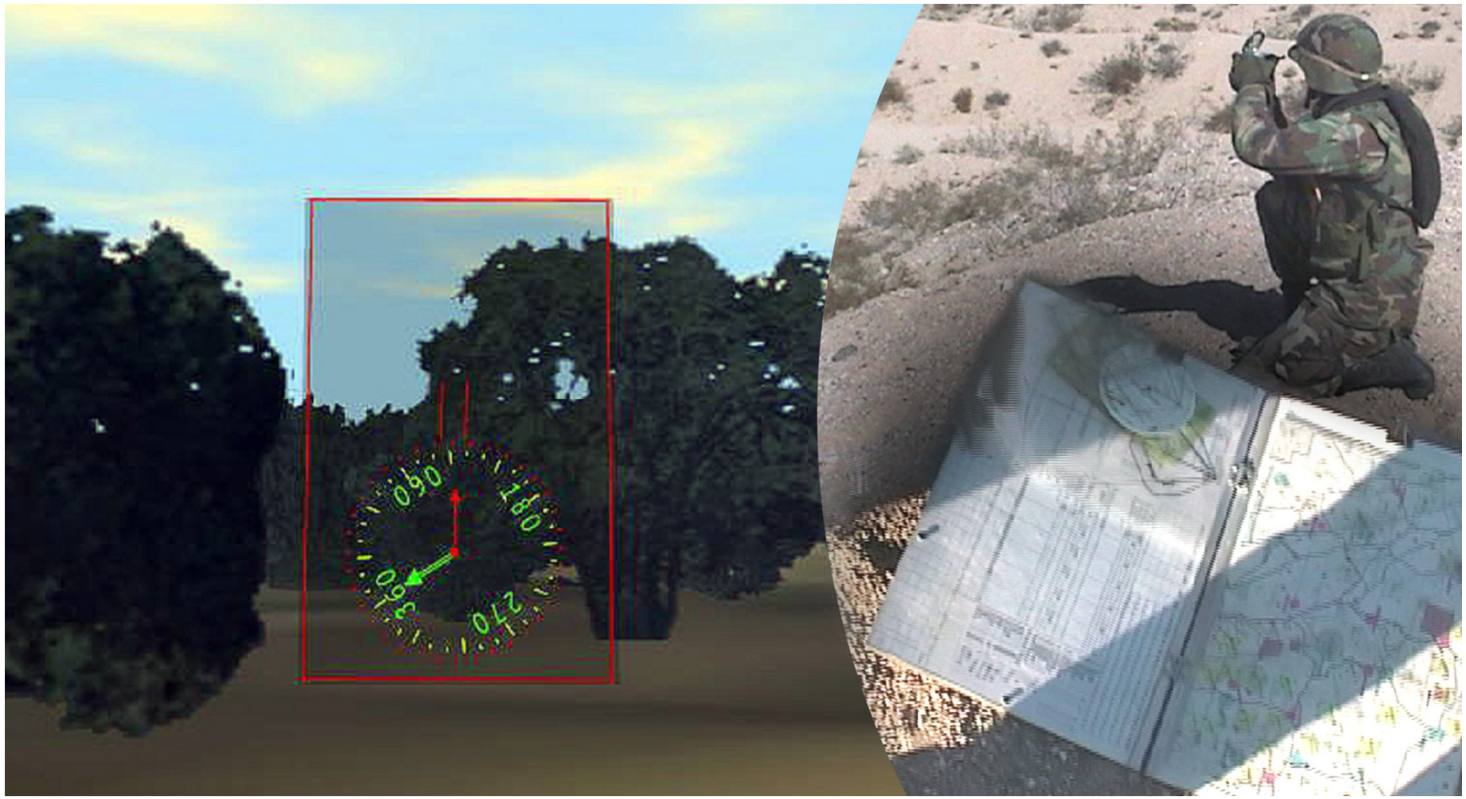


You are here marker
N
Street correspondance on map (running left to right)
north-up map
N
Street correspondance on map (running buttom to top)
forward-up map

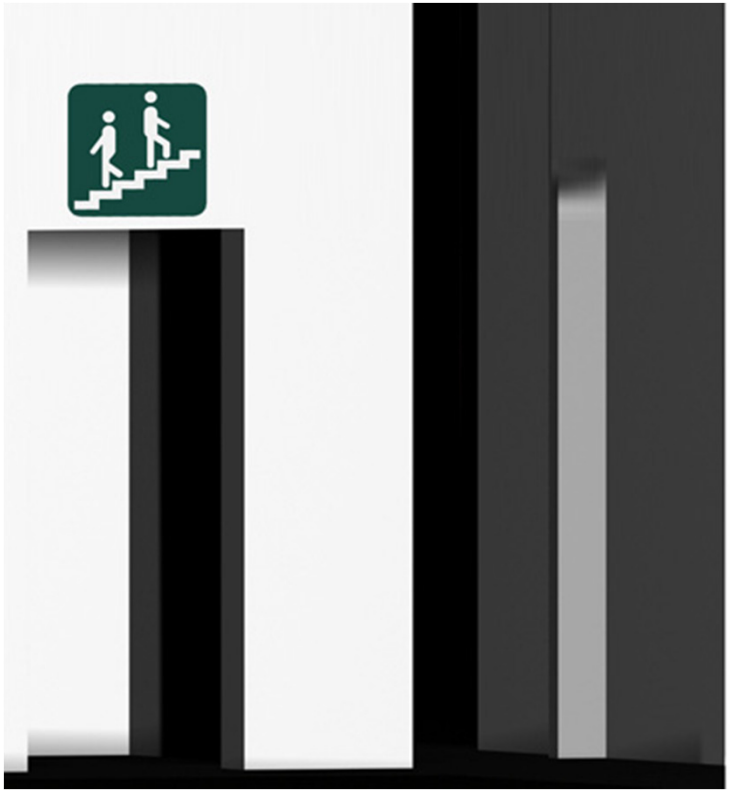
Maps (4)



Compasses



Signs



Reference Objects

- Objects that have well known size
  - chair, human figure, etc…
- Useful to estimate distances

Artificial Landmarks

- Local – help users in decision making processes
- Global – seen from any location

Trails

- Help user retrace steps
- Show what parts have been visited

Navigation

Travel – Motor Component

Travel

- The motor component of navigation
  - Good travel techniques integrate aids to wayfinding
- Movement between two locations, setting the position (and orientation) of the user's viewpoint
- The most basic and common VE interaction technique, used in almost any large-scale VE

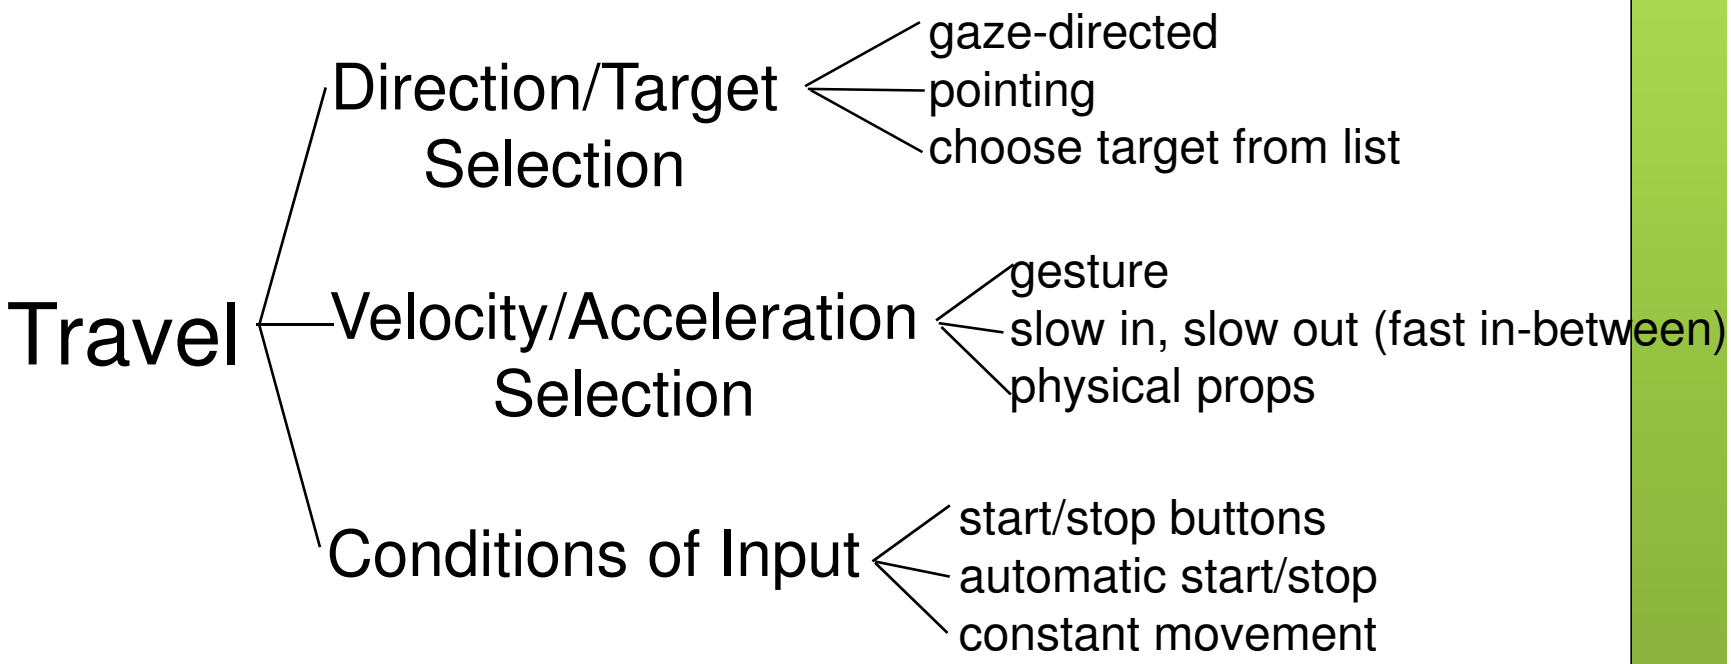
Travel Tasks

- Exploration
  - travel which has no specific target
  - build knowledge of environment
- Search
  - naïve: travel to find a target whose position is not known
  - primed: travel to a target whose position is known
  - build layout knowledge; move to task location
- Maneuvering
  - travel to position viewpoint for task
  - short, precise movements

Travel Characteristics

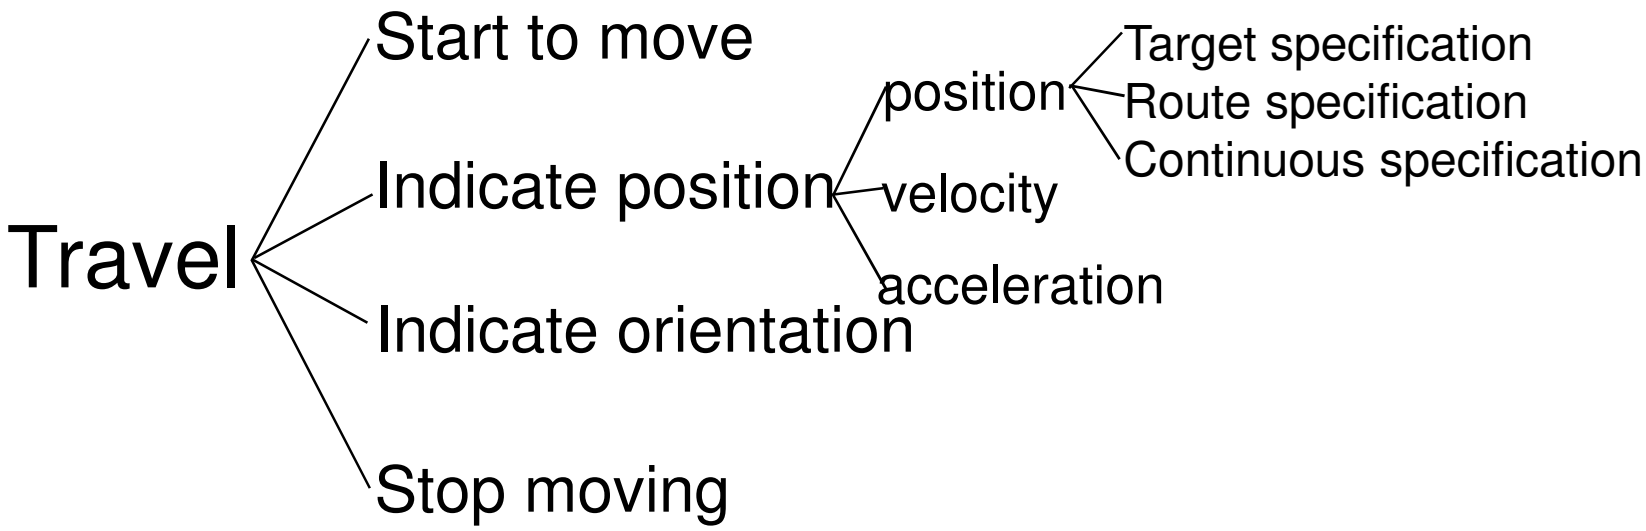
- Travel distance
- Amount of curvature/number of turns in path
- Target visibility
- DOF required
- Accuracy required
- Other tasks during travel
- Active vs. passive
- Physical vs. virtual

A Technique Classification – Component Decomposition



From: Bowman, Koller, and Hodges, Travel in Immersive Virtual Environments. IEEE VRAIS '97

Alternate Technique Classification – User Control Level



Travel Techniques

- Physical locomotion ("natural" metaphors)
- Steering techniques
- Route planning
- Target-based techniques
- Manual manipulation
- Viewpoint orientation techniques

Physical Locomotion Techniques

- Walking techniques
  - Large-scale tracking
  - Walking in place
- Treadmills
  - single-direction with steering (Gait Master)
  - omni-directional
- Bicycles
- Other physical motion techniques
  - Magic carpet
  - Disney's river raft ride

Large Scale Tracking

Omni-Directional Treadmill

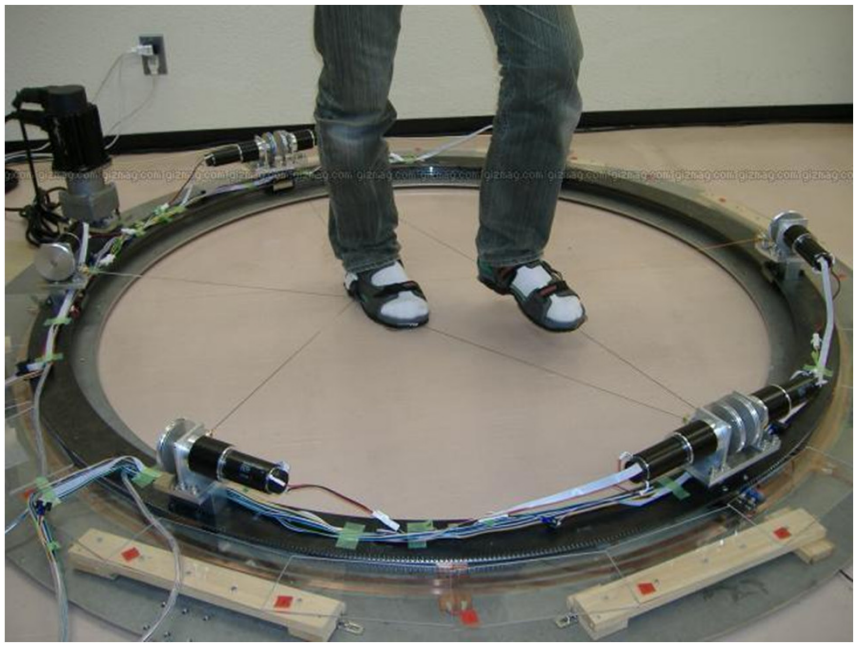
- Video:
  - http://www.youtube.com/watch?v=BQw1tsgrJOs

Gait Master

- Video
  - http://www.youtube.com/watch?v=RDDH1iqoDzU

String Walker

- Video from Emerging Technologies, SIGGRAPH 2007
  - http://www.youtube.com/watch?v=hyLKjyL-Dw8



Steering Techniques

- Continuous specification of direction of motion
  - gaze-directed
  - pointing
  - torso-directed
  - camera-in-hand
  - physical device (steering wheel, flight stick)

Steering – Gaze-Directed

- Move viewpoint in direction of "gaze"
- Gaze direction determined from head tracker
- Cognitively simple
- Doesn't allow user to look to the side while traveling

Steering – Gaze-Directed Implementation

- Each frame while moving:
  - Get head tracker information
  - Transform vector *[0,0,-1]* in head CS to *v=[x,y,z]* in world CS
  - Normalize v: $\hat{v} = \frac{v}{\|v\|}$
  - Translate viewpoint by ty

Pointing Technique

- Also a steering technique
- Use hand tracker instead of head tracker
- Slightly more complex, cognitively
- Allows travel and gaze in different directions – good for relative motion

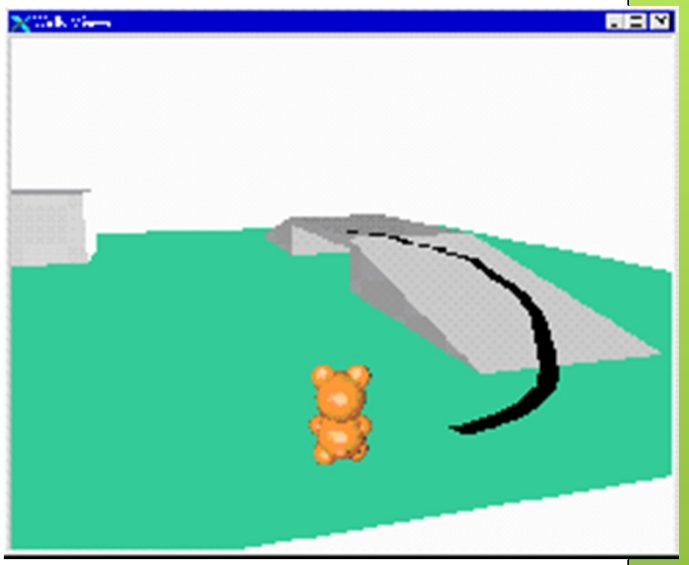
Pointing Implementation

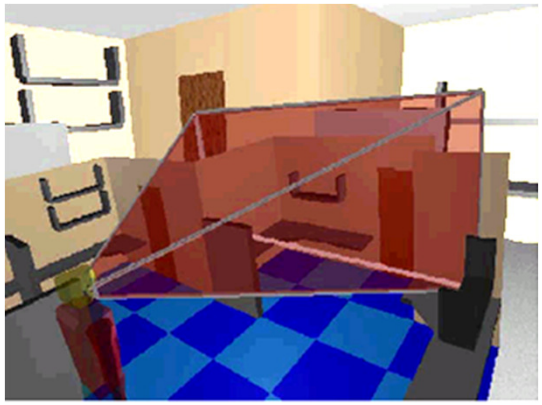
- Each frame while moving:
  - Get hand tracker information
  - Transform vector *[0,0,-1]* in hand CS to *v=[x,y,z]* in world CS
  - Normalize v: $\hat{v} = \frac{v}{\|v\|}$
  - Translate viewpoint by

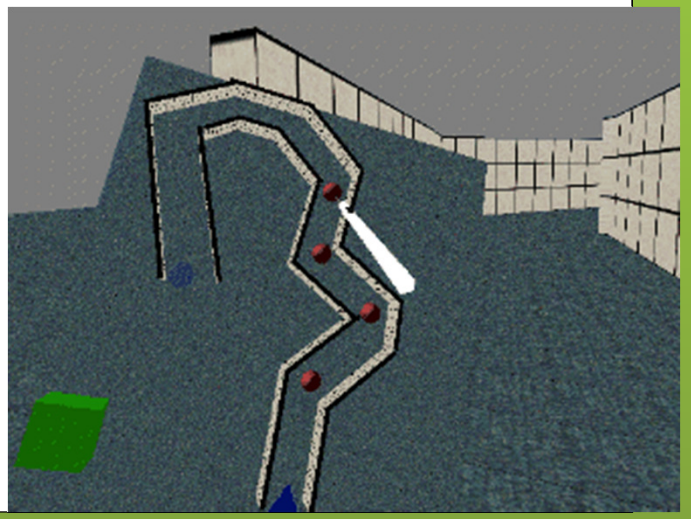
$$(\hat{v}_x, \hat{v}_y, \hat{v}_z) \times current\_velocity$$

Route-Planning

- One-time specification of path
  - draw path
  - points along path
  - manipulating user representation





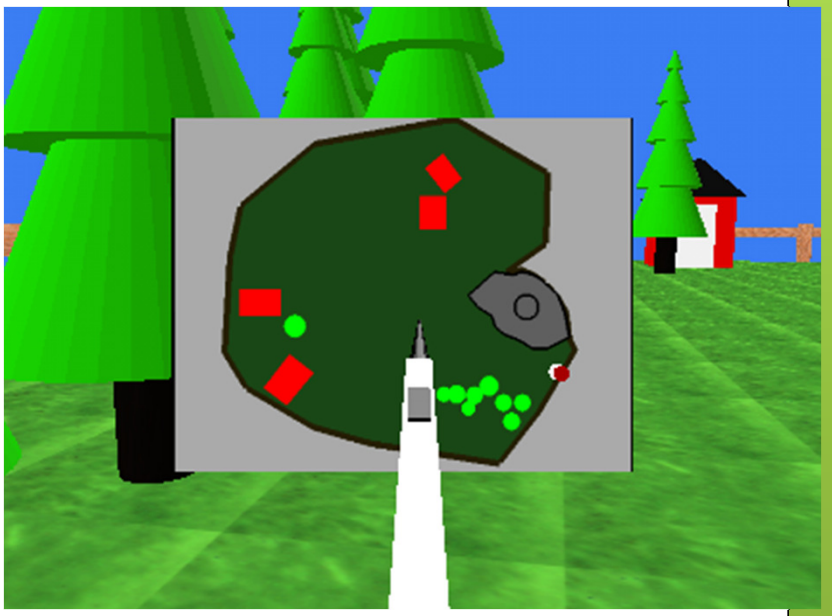


Target-Based Techniques

- Discrete specification of goal
  - point at object
  - choose from list
  - enter coordinates
- Map/WIM-based target specification

Map-Based Travel Techniques

- User represented by icon on 2D map
- Drag icon with stylus to new location on map
- When released, viewpoint animated smoothly to new location



Map-based Travel Implementation

- Must know
  - map scale relative to world: *s*
  - location of world origin in map CS: $o=(x_o, y_o, z_o)$
- On button press:
  - if stylus intersects user icon, then each frame:
    - get stylus position in map CS: *(x, y, z)*
    - move icon to *(x, 0, z)* in map CS

Map-Based Travel Implementation (cont.)

- On button release:
  - Get stylus position in map CS: *(x, y, z)*
  - Move icon to *(x, 0, z)* in map CS
  - Desired viewpoint: $p_v = (x_v, y_v, z_v)$ where
    - $x_v = (x - x_o)/s$
    - $z_v = (z - z_o)/s$
    - y_v = *desired height at* (x_v, y_v)
  - Move vector: $m = (x_v\text{-}x_{curr}, y_v\text{-}y_{curr}, z_v\text{-}z_{curr}) *$ *(velocity/distance)*
  - Each frame for *(distance/velocity)* frames: translate viewpoint by *m*

Manual Manipulation – Grabbing the Air Technique

- Use hand gestures to move yourself through the world
- Metaphor of pulling a rope
- Often a 2-handed technique
- May be implemented using Pinch Gloves

Grabbing The Air Implementation (One-handed)

- On pinch:
  - Obtain initial hand position in world CS: (x_h, y_h, z_h)
- Each frame until release:
  - Obtain current hand position in world CS: (x'_h, y'_h, z'_h)
  - Hand motion vector: $m = ((x'_h, y'_h, z'_h) - (x_h, y_h, z_h))$
  - Translate world by m (or viewpoint by $-m$)
  - $(x_h, y_h, z_h) = (x'_h, y'_h, z'_h)$
- Cannot simply attach objects to hand – do not want to match hand rotations

Viewpoint Orientation Techniques

- Head tracking
- Orbital viewing
- Non-isomorphic rotation
- Virtual sphere
